General Delivery

From the President
Bart Childs

The last issue of TUGboat (Vol. 8, No. 1) represents a measure of success in my mind. The number of contributions, their content, and all other measures of quality made it interesting and useful. I hesitate to mention any one paper, but a number of people have commented about their high interest on several of the papers. Let’s keep up the good work.

Several people have been spreading the good word about \TeX in national publications. We should publish a listing of these references soon.

Robert McGaffey’s note in this issue (page 161) on the Ideal \TeX Driver poses questions about standards that we need to address soon. Don Knuth created \TeX to be portable, but the output drivers are of critical importance in making the system truly portable. I hope that we can have a significant session on this at the Seattle meeting.

Another topic that needs to be addressed is the use of fonts and magnification. It has been an active item in \TeXhax. The particular item I am most concerned with is the extensive use of magnification in the \LaTeX and \Stex worlds. The \cm family has the needed fonts in 12 and 17 point sizes. Shouldn’t we always distribute only magnifications 0, half, 1 and 2? Maybe one or two fonts should have a lot of magnifications for use in titles? Come to Seattle and be ready to argue the points.

One more topic of this type is that we need to make a concerted effort to discard the old \am family of fonts. Does anyone have a good reason to keep them around? With the exception of the \amsme fonts, almost all have such a simple change that it seems past due.*

We are looking forward to meeting in the great Northwest. Dean Guenther and Pierre MacKay are coordinating the usual TUG sessions and the \TeX in the humanities sessions, respectively.

---

* Editor’s note: We are pleased to announce that this issue of TUGboat has been set with the \cm fonts resident on the Math Society’s new Autologic APS-\mu5 phototypesetter. These fonts are still being tested; however, testing should soon be complete, and they will then be made available from Autologic to other APS users.

A Simple Way to Improve the Chances for Acceptance of your Scientific Paper

To the Editor: During the past few years we have witnessed a revolution in the way manuscripts, abstracts, and grant proposals are being typed. With improved typewriters and computer programs it is possible to produce manuscripts of typeset quality. It is generally assumed that data should be judged by its scientific quality and that this judgment should not be influenced by typing style.

I challenged this premise by analyzing the rate of acceptance of abstracts by a large national meeting. All abstracts submitted to the 1986 annual meeting of the American Pediatric Society and the Society of Pediatric Research (APS/SPR) appeared in Volume 20, No. 4 (Part 2) (April 1986) of Pediatric Research. Contrary to the practice of many other meetings, this volume also includes all the abstracts that were not accepted for presentation, and accepted papers are identified by symbols.

Abstracts were defined as “regularly typed” or “typeset printed.” Each abstract was categorized as accepted if chosen for presentation or rejected. A total of 1965 abstracts were evaluated. Excluded were 47 abstracts assigned for joint internal medicine–pediatric presentation, because the majority of them were submitted to the American Federation for Clinical Research, and there was no indication of their rejection rate; only those that had been accepted appeared in the APS/SPR book of abstracts.

Of the 1918 evaluable abstracts, 1706 were regularly typed and 212 were “typeset.” The acceptance rate was significantly higher for the “typeset” abstracts: 107 of 212 (51.4 percent) vs. 747 of 1706 (44 percent) (P < 0.05).

Eighty-eight investigators submitted five or more abstracts to the meeting. Here, too, there was a higher rate of acceptance for the “typeset” abstracts (62 of 107; 57.9 percent) as compared with the regularly typed abstracts (184 of 451; 40.8 percent) (P = 0.002).

One may argue that investigators who can afford the new equipment for printing abstracts have more money and can afford better research, and therefore that their abstracts are accepted at

Editor’s note: The following item appeared in the New England Journal of Medicine, Nov. 13, 1986, and is reprinted with permission.

higher rates. To explore this possibility, I analyzed data on the 15 investigators who submitted five or more abstracts each and who used both typing methods. In this subgroup, 19 of 55 regularly typed abstracts were accepted (34.5 percent), whereas 31 of 53 of the "typeset" abstracts were accepted (58.5 percent) \( (P = 0.015) \).

These results demonstrate that the new "typeset" appearance of data increases the chance of acceptance. It may mean that "typeset" printing may cause the data to look more impressive. Alternatively, it may mean that the new printing makes it easier for reviewers to read the data and to appreciate its meaning.

Most important, it means that this technological innovation reduces the chance of success of those not currently using it.

### Software

**Tlb: a Reference Setting Package, Update**

J. C. Alexander
University of Maryland

There have been a number of minor bug fixes and some refining of features of the \TeX\ bibliography setter Tlb (see TUGboat vol. 7, no. 3, for an article about Tlb). Its version number has been incremented. Those people who asked to be put on my mailing list have been sent all the changes. However, I know from mail that there are a number of other users, presumably people who picked it up via anonymous ftp. Those people might want to check the file CHANGES and/or README.ME via anonymous ftp from ennevax:pub/tlb. Incidentally, I appreciate the kind comments and suggestions people have made. It seems Tlb is proving to be a useful adjunct to \TeX.

**Portuguese Hyphenation Table for \TeX**

Pedro J. de Rezende
Northeastern University

I have compiled a Portuguese hyphenation table for \TeX. It turns out to be a rather short table (compared to the one for English) because Portuguese has very concise rules for hyphenation. I'd like to make this table public and freely distributed. Even included in the distribution tapes. I have extensively tested it (with patgen) and haven't found any erroneous hyphenation. It does miss some hyphens but they are very, very few. It certainly does not hyphenate a word beyond an accent or a cedilla, but that's the way \TeX\ handles hyphenation of words with intervening macros (see Appendix H of The \TeX\book).

Editor's note: Arrangements are being made to include the Portuguese hyphenation table in the standard distribution. Hyphenation tables for languages other than English are frequently requested on mhax; anyone who knows of the existence of such tables is asked to send the relevant information to Barbara Beeton, so that a list can be compiled for the next issue of TUGboat.

**A (Hopefully) Final Extension of Multilingual \TeX**

Michael J. Ferguson
INRS-Télécommunications
Montréal, Canada

This note reports the, hopefully, final extension to \TeX\ that allows for multilingual hyphenation reported in July 1985 (Vol. 6, No. 2, pp. 57–58) and March 1986 (Vol. 7, No. 1, page 16) of TUGboat. The key feature of the extension is that it accommodates standard \TeX\ fonts, including words with accented letters. For details of the features the reader should refer to the July 1985 TUGboat. This note reports some recent extensions to accommodate certain typographical and input conventions in non-English text. These extensions are as follows:
