Contents of Issue 25

Numéro 25 — novembre 1996

Editor’s note: While this is the first non-thematic issue since no. 18 (!), there still seems to be a certain cohesiveness running through four of the six articles: issues and uses of \TeX\ in real situations. They are as interesting for their examination of the respective problems as for the history of change they reflect — change in fonts, change in \TeX\ installations, change in language. As a side note, this issue has no lead editorial to introduce the articles.

Thierry Bouche, Sur la diversité des fontes mathématiques [Regarding the diversity of math fonts]; pp. 1–24

We are interested in the issues which arise when changing the fonts used by \LaTeX\’s math modes. We will try to provide some concrete solutions for accessing a larger variety of fonts, without falling victim to typographic nonsense.

[from the Résumé]

[The author’s abstract belies the significance and interest of his article, which explores in detail the issues which surround this particular problem with \TeX\ math material: the need for a greater variety of font combinations for text and maths. Starting with CM, Lucida, and MathTime, the author then experiments with mathptm and mathfont (his own virtual font), in combination with the text fonts Apollo and Utopia. Several examples of text + math are shown,\footnote{It is my great misfortune to have a copy with several faintly printed pages.} along with details of the \LaTeX\ coding.]

Christian Lenne, Édition structurée et non structurée d’expressions mathématiques dans Thot [Structured and non-structured editing of math expressions, using Thot]; pp. 25–32

Document writing in the scientific world or leading-edge industries must have the tools/options for expressing mathematical formulas. Commercial word processing tools offer little such functionality, or can offer only that functionality. In this article, we will present the approach we have used with the Thot structured document editor.

[from the Résumé]
This article discusses the experiences of a "normal" \TeX user— as opposed to a \TeXpert, that is—in "Frenchifying" and using \Y\TeX.

[from the Introduction]

[The article begins with a brief overview of \Y\TeX, followed by some comments on why the implementation is of particular interest to the European \TeX user: the ease of use and access to PS fonts not only for printing but also previewing, and recording options, particularly of accented characters. Incompatibility of encodings arises when source files meet \TeX and when \dvipdf output files meet previewers. \Y solutions on both fronts are discussed, with particular reference to the three main components of the package: Yand\TeX, the newly renamed \TeX implementation; \DVIPWINDO, the previewer; and \DVIPSONE, the printer driver. The article concludes with a run-down of the font families available in PS format: the CM fonts, LucidaBright (including the expert set), and mathitime, a maths font to go with Adobe's Times Roman. The author says: "Other than the systematic approach to PS, there's nothing revolutionary here ... What is worth noting is the coherence of the whole system ... the communication across processes."

[Marc Torzynski, Histoire de \TeX sous Dos et Windows à l'École nationale supérieure de physique de Strasbourg [\TeX under Dos and Windows at the National College of Physics in Strasbourg]; pp. 41–56

By outlining the evolution of the \TeX installation at his site, the author shows how he came to develop various working environments under DOS and Windows. The tools have been installed on the facility's intranet and are available to both staff and students.

[from the Résumé]

[Quite a detailed history, beginning with "Life before \TeX", "The Arrival of \TeX at the College", and "Discovering \TeX for the PC". Then begins the real work: installing \TeX on an MS-DOS network, and the eventual migration to Windows for Workgroups. After a year and a half, the author feels he can say: "The basic problems seem to have been identified and corrected, and the working environment is now stable."

[Marcel Torzynsky, Histoire de \TeX sous Dos et Windows à l'École nationale supérieure de physique de Strasbourg [\TeX under Dos and Windows at the National College of Physics in Strasbourg]; pp. 41–56
