2 – Blinds transition	5
3 – Box transition	7
4 – Dissolve transition	9
5 – Glitter transition	10
6 – Replace transition	12
7 – Split transition	13
8 – Wipe transition	15

Demonstration of transitions

1 – Introduction

- ☞ The transitions describe how a page replace the preceding one on the screen
- ☞ The transitions supported are described in the *PDF Reference Manual*, paragraph 8.3, pages 486-487 (version 1.4)^a
- ☞ **Seminar** doesn't manage anything for the transitions. We just use the `pdfpagetransition` parameter of the 'hyperref' package to specify the one to use.
- ☞ The available transitions are:
 - ⇒ **Blinds**: the screen is splitted in several parts to show the new page, like Venetian blinds,
 - ⇒ **Box**: a box increase or decrease to show the new page,
 - ⇒ **Dissolve**: the old page is cut in small squares which are progressively replaced by squares of the new one,
 - ⇒ **Glitter**: like *Dissolve*, but from one edge to another,
 - ⇒ **Replace**: the old page is only replaced by the new one (this is the default),
 - ⇒ **Split**: the screen is splitted in two parts to show the new page,
 - ⇒ **Wipe**: a line wipes the old page to show the new page.

Demonstration of transitions

Wipe.

Split.

Replace.

Glitter.

Dissolve.

Box.

Blinds.

Introduc.

- ☞ Some parameters can influence the behavior:
- ⇒ **Di** (Direction): numerical value equal to **0**, **90**, **180**, **270** or **315** (*Glitter* only), which give the angle used (this concern only the *Glitter* and *Wipe* transitions),
 - ⇒ **Dm** (Dimension): possibles values are **/H** (/Horizontal) and **/V** (/Vertical) (this concern only the *Blinds* and *Split* transitions),
 - ⇒ **D** (Duration): numerical value equal to the number of seconds of the effect,
 - ⇒ **M** (Motion): possibles values are **/I** (/In) (by default) and **/O** (/Out) (this concern only the *Box* and *Split* transitions).

Demonstration of transitions
