The m-visual module is used in some manuals that come with ConTEXt to generate random text. This is sometimes less confusing than nice quotes because the reader can then distinguish the explanation from the example. This module is not extensive (but may grow) and is just an addition to already built-in visualization tools.
Remark

When again a user asked me for the macros that I use to generate fake text, I took a while to document them. Most macros use the built in random number generator. In manuals you may want to control the randomization a bit. You can do that by setting the seed:

\setupystem [random=12345]

In MkIV there is a lot of visualization available like showing all boxes, glue, characters etc. (try \showmakeup). Many mechanism have dedicated trackers that visualize matters with color. Here we just mention a few possibilities of a module with helpers. This module is loaded with:

\usemodule [visual]

Faking words

We don’t need much words to demonstrate the macros. Here we fake a single work with \fakeword: 

\fakewords {100}{200} \par
\fakewords {30} {80} \par
\fakewords {200}{200}
In addition to \texttt{\fakewords} we have \texttt{\fakenwords}. This time we don't specify a range, but a number and a random seed.

\texttt{\fakenwords{100}{2}} \% words seed

Drop caps can be faked as follows:

\texttt{\fakedroppedcaps{3}}
\texttt{\fakenwords{100}{200} \par}
\texttt{\fakenwords{100}{200}}
You can visualize the indentation by adding another faker:

```
fakeparindent \fakewords{100}{200}
```

You can suppress indentation with:

```
\onlyfakewords{100}{200}
```

You can influence the color by redefining one or more of the following fake colors:

```
\definecolor[fakerulecolor] [black]
\definecolor[fakebaselinecolor] [green]
\definecolor[fakeparindentcolor] [blue]
```

In case you wonder if fake words hyphenate, they kind of do, as is shown here:
Faking lines

Lines can be faked with:
\fakelines{3}{5}
\fakelines{4}{8}

This is (of course) more efficient than faking words.

Faking figures

Faking figures does not make that much sense.

\fakefigure
[\left][]
\{10em\}{12em}
\{3\text{lineheight}\}{5\text{lineheight}}

\fakewords{100}{200}
In this case the width will vary between 10em and 12em, while the height end up somewhere between 3 and 5 times the lineheight.

If you want nice placeholders you can better use the MetaPost dum library. This one hooks into the external figure placement macros and will produce a random graphic (with more or less random colors).

\useMPlibrary[dum]
\placefigure
  [left][]
  {\fakewords{3}{6}}
  {\externalfigure[ForTheMomentFaked][width=3cm,height=2cm]}

\fakewords{100}{200}
Faking formulas

Another probably seldom used placeholder is \fakeformula:

\startformula \fakeformula \stopformula

\[ + + + + + = \]

An alternative, showing baselines, is:

\startformula \fakespacingformula \stopformula

\[ + + + = \]

You can trigger drawing of baseline yourself too:

\showbaselines
\fakewords{100}{200} \par
\fakewords{30}{80} \par
\fakewords{200}{200}
In this case you will notice that this document is not typeset on a grid, and therefore, since the blank space is set to big the baseline visualization shows this distance when applicable.

\subject{Remark}\n
When again a user asked me for the macros that I use to generate fake text, I took a while to document them. Most macros use the built in random number generator. In manuals you may want to control the randomization a bit. You can do that by setting the seed:
\starttyping
\setupystem[random=12345]
\stoptyping
\% Some more visualization tricks are discussed in the visual debugger modules \texttt{\type{supp-vis.tex}} and \texttt{\type{core-vis.tex}}. If you have special wishes, let me know.\n\% If they make sense (or more important: if they can be implemented in a decent way) they may be honored in the future.

In \texttt{\MKIV} there is a lot of visualization available like showing all boxes, glue, characters etc. \(\text{(try \texttt{\showmakeup})}\). Many mechanism have dedicated trackers that visualize matters with color. Here we just mention a few possibilities of a module with helpers. This module is loaded with:
\starttyping
\usemodule[visual]
\stoptyping
\subject{Faking words}
We don’t need much words to demonstrate the macros. Here we fake a single work with \type {\fakeword}: \fakeword. You can fake a whole bunch with:

\startbuffer
\fakewords {100}{200} \par
\fakewords {30} {80} \par
\fakewords {200}{200} \par
\stopbuffer
\typebuffer \getbuffer

In addition to \type {\fakewords} we have \type {\fakenwords}. This time we don’t specify a range, but a number and a random seed.

\startbuffer
\fakenwords {100}{2} \% words seed
\stopbuffer
\typebuffer \getbuffer

Drop caps can be faked as follows:

\startbuffer
\fakedroppedcaps {3} \\
\fakewords {100}{200} \par
\fakewords {100}{200} \\
\stopbuffer
\typebuffer \getbuffer

You can visualize the indentation by adding another faker:

\startbuffer
\fakeparindent \fakewords {100}{200} \\
\stopbuffer
\typebuffer \getbuffer

You can suppress indentation with:

\startbuffer
\onlyfakewords {100}{200} \\
\stopbuffer
\typebuffer \getbuffer

You can influence the color by redefining one or more of the following fake colors:

\startbuffer
\definecolor \fakerulecolor [black]
\definecolor \fakebaselinecolor [green]
\definecolor \fakeparindentcolor [blue] \\
\stopbuffer
\typebuffer \getbuffer

In case you wonder if fake words hyphenate, they kind of do, as is shown here:

\bgroup \showfakewords \onlyfakewords {100}{200} \egroup

\subject {Faking lines}

Lines can be faked with:
This is (of course) more efficient than faking words.

Faking figures does not make that much sense.

In this case the width will vary between \texttt{10em} and \texttt{12em}, while the height end up somewhere between 3 and 5 times the lineheight.

If you want nice placeholders you can better use the \texttt{METAPOST\ type {dum}} library. This one hooks into the external figure placement macros and will produce a random graphic (with more or less random colors).
