A *fitthesis3* user guide
for the Faculty of Informatics

Bachelor’s Thesis

Vít Novotný

Brno, Spring 2018
Declaration

Hereby I declare that this paper is my original authorial work, which I have worked out on my own. All sources, references, and literature used or excerpted during elaboration of this work are properly cited and listed in complete reference to the due source.

Vít Novotný

Advisor: Doc. RNDr. Petr Sojka, Ph.D.
Abstract

Fithesis3 is a \LaTeX document class, which streamlines the typesetting of the mandatory parts of theses, so that the author can focus at content alone. Fithesis3 can be used to write theses in various languages across the faculties of the Masaryk University.

This document describes the installation of the fithesis3 class, its configuration and its use at the Faculty of Informatics. As a demonstration of its capabilities, this document was typeset using the fithesis3 class.
Keywords

thesis, typesetting, \LaTeX
List of Figures

3.1 A document with disabled autoLayout  17
1 Introduction

To use the fithesis3 class, you can use an online \TeX\ editor, such as Overleaf\textsuperscript{1}, which allows you to skip the installation described in Section 1.1 completely.

Another way to avoid installation is to use any public-access computer at the Faculty of Informatics that runs Microsoft Windows. By running

\texttt{Start} \rightarrow \texttt{Programs} \rightarrow \texttt{Document Tools} \rightarrow \texttt{TeXLive2018 namapovani na T}

you can mount the faculty \TeX\ Live installation to drive T:\. Consequently, you can either use the command line to run commands from the \TeX\ distribution by running

\texttt{Start} \rightarrow \texttt{Programs} \rightarrow \texttt{Document Tools} \rightarrow \texttt{TeXLive2018 CMD}

or you can use the graphical \TeX\ editor \TeX\Works by running

\texttt{Start} \rightarrow \texttt{Programs} \rightarrow \texttt{Document Tools} \rightarrow \texttt{TeXWorks+TeXLive2018}

Yet another way to avoid installation is to either connect to the Linux server at ais\texttt{a.fi.muni.cz} over SSH, or use any public-access computer at the Faculty of Informatics that runs Linux or Mac OS, and load the faculty \TeX\ Live installation by issuing the \texttt{module add texlive} command on the command line. If you choose this approach, you can also skip the entire Section 1.1, although a certain degree of proficiency in working with a Unix operating system is required compared to the other methods.

1.1 Installation

1.1.1 Installing a \TeX\ distribution

If you decided not to use a public \TeX\ distribution, you will need to install one locally before proceeding further. A \TeX\ distribution contains tools and packages that are going to help you with preparing and typesetting your \LaTeX\ documents.

\textsuperscript{1. Overleaf fithesis3 templates are located at }\url{http://www.overleaf.com/gallery/tagged/muni}. 
1. Introduction

The two major \TeX{} distributions that you can install are Mik\TeX{},\(^2\) which can be used with the Microsoft Windows operating system, and \TeX{} Live,\(^3\) which can be installed on both Unix and Windows operating systems. The advantages of Mik\TeX{} over \TeX{} Live include refined graphical user interface and the ability to install new packages on the fly.

Along with Mik\TeX{}, you will also need to install a Perl interpreter, such as Strawberry Perl.\(^4\) \TeX{} Live installs a Perl interpreter by default.

1.1.2 Installing packages

In order to function properly, fithesis\(^3\) needs the following packages to be installed in your \TeX{} distribution: keyval, etoolbox, ifxetex, ifluatex, inputenc, xcolor, graphix, pdffile, hyperref, microtype, tikz, fonts, unicode-math, mathpazo, tex-gyre-pagella, lm, cmap, fontenc, tabularx, tabu, booktabs, csquotes, biblatex, fithesis.

If you performed a full installation of \TeX{} Live, you should already have all the required packages installed. If you are using a partial installation of \TeX{} Live, you can use the `tlmgr` command-line tool by executing `tlmgr install ⟨pkgname⟩`, where `⟨pkgname⟩` is the name of the package you wish to install. In some cases, \TeX{} Live may assign a different name to a package. To find out the \TeX{} Live name of a package, open the `http://www.ctan.org/pkg/⟨pkgname⟩` webpage in a web browser. It should contain the following text:

```
contained in \TeX{} Live as ⟨texlivename⟩
```

where `⟨texlivename⟩` corresponds to the \TeX{} Live name of the package. Use this name instead of `⟨pkgname⟩` with `tlmgr`. Alternatively, you can download the packages manually from `http://www.ctan.org/pkg/⟨pkgname⟩` and extract them into the \texttt{texmf/} directory located in your user home directory. Mind that the packages themselves may depend on other packages; if you are using a partial installation of \TeX{} Live, you will have to resolve these dependencies manually by inspecting the documentation of each package.

---

2. Mik\TeX{} can be acquired from `http://miktex.org/2.9/setup`.
3. \TeX{} Live can be acquired from `http://www.tug.org/texlive`.
1. Introduction

If you use MikTeX and you enabled the over the air installation of packages during the installation, MikTeX will automatically download all the required packages, when you first typeset a fibeamer document. If you didn’t enable this feature, you will need to enter the MikTeX package manager by running

```
Start MikTeX MikTeX Package Manager (Admin)
```

and download the packages manually through the user interface. In some cases, MikTeX may assign a different name to a package. To find out the MikTeX name of a package, open the http://www.ctan.org/pkg/⟨ pkgname ⟩ webpage in a web browser, where ⟨ pkgname ⟩ is the name of the package you wish to install. It should contain the following text:

```
Contained in MikTeX as ⟨miktexname⟩
```

where ⟨miktexname⟩ corresponds to the MikTeX name of the package. If you still can’t find the package, try synchronizing the package database by selecting

```
Repository Synchronize
```

from the menu bar of the MikTeX package manager. Mind that the packages themselves may depend on other packages; if you disabled the over the air installation of packages, you will have to resolve these dependencies manually by inspecting the documentation of each package.

If you wish to use a newer version of fithesis3 than the one that is available in your TeX distribution, you should download a file named fithesis.tds.zip containing the version of the package you wish to use and place it in a root directory that is recognized by your TeX distribution. In TeX Live,⁵ one of such directories is the texmf/ folder in your user home directory. In MikTeX,⁶ the list of recognized root directories can be gleaned by running

```
Start MikTeX MikTeX Options (Admin) Roots
```

---

⁵ For more information about the TeX Live root directories, see http://www.tug.org/texlive/doc/texlive-en/texlive-en.html#x1-110002.3, Chapter 2.3.
⁶ For more information about the MikTeX root directories, see http://docs.miktex.org/manual/localadditions.html.
1. Introduction

1.2 Picking a \TeX{} engine

There are several programs, called \TeX{} engines, that you can use to typeset \fithesis{} \LaTeX{} source files into displayable pdf documents. The ones we will discuss are pdf\TeX{} and Lua\TeX{}.

Pdf\TeX{} is the more conservative choice and most \TeX{} editors use pdf\TeX{} as the default \TeX{} engine. The main advantage Lua\TeX{} over pdf\TeX{} for a \fithesis{} user is the ability to use standard OpenType and TrueType fonts installed on your system, whereas pdf\TeX{} is confined to the fonts installed in your \TeX{} distribution.

If the ability to use arbitrary fonts within your documents interests you, Chapter 3 of the fontspec package manual\(^7\) should provide you with the relevant information. If you are only going to use the fonts present in the \TeX{} distribution or if you do not intend to change the preset \fithesis{} fonts at all, you can safely use pdf\TeX{}, which is currently also considerably faster than Lua\TeX{}.

1.3 Creating and typesetting a \fithesis{} document

Before using the \fithesis{} class, it is useful to be familiar with the \LaTeX{} typesetting system. A good way to get started is to read one of the introductory texts in English [1, 2, 3, 4] or in Czech [5, 6]. Taking one of the F1:PB029, PFF:M5751, or FF:PLIN028 courses taught at the Masaryk University is also helpful.

To become familiar with \fithesis{}, you are encouraged to inspect the example documents fi-pdflatex.pdf and fi-lualatex.pdf as well as their \LaTeX{} source files that are named fi-pdflatex.tex and fi-lualatex.tex. The example documents are distributed along with the package inside the example/ directory.\(^8\). By modifying and by typesetting these \LaTeX{} source files using either the pdf\TeX{} or the Lua\TeX{} engine, you can quickly gain a working knowledge of \LaTeX{} and use these source files as the basis for your thesis.

\(^7\) The fontspec package manual is available at http://mirrors.ctan.org/macros/latex/contrib/fontspec/fontspec.pdf.

\(^8\) The example \fithesis{} documents are also available online at http://mirror.ctan.org/macros/latex/contrib/fithesis/example/mu. To typeset the example documents, you need to download the example.bib file as well, as it contains the bibliography database used in the examples.
1. Introduction

If you are using an online editor, such as Overleaf\textsuperscript{9}, \LaTeX\ source files will be typeset automatically, as you edit them. The \TeX\ engine can be selected inside the \textsuperscript{\textregistered} project settings.

If you are using a graphical \TeX\ editor, such as \TeX\works,\textsuperscript{10} you can typeset a \LaTeX\ source file by opening the source file from within the editor and running either the pdf\LaTeX\ or Lualatex (depending on your choice of \TeX\ engine) command from the task bar. The command needs to be executed at least twice to produce the table of contents, the list of tables, and the list of figures. Additional commands for the typesetting of the bibliography and the index are described in the example documents.

If you are using the command line, you can typeset \LaTeX\ source files by running either the pdf\LaTeX\ --shell-escape \texttt{name.tex} command or the lualatex \texttt{name.tex} command depending on your chosen \TeX\ engine, where \texttt{name.tex} corresponds to the name of a \LaTeX\ source file. In the case of the two aforementioned example files, the corresponding commands would be

\begin{verbatim}
pdf\LaTeX\ --shell-escape fi-pdflatex.tex for pdf\LaTeX,
and lualatex fi-lualatex.tex for Lualatex.
\end{verbatim}

The command needs to be executed from within the directory, where the \LaTeX\ source file is located. In Windows, the command line can be opened in a directory by holding down the [Shift] key and by clicking the right mouse button while hovering the cursor over a directory. Select the [Open Command Window Here] option in the context menu that opens shortly afterwards. The command also needs to be executed at least twice.

Beside Overleaf and \TeX\works, any text editor can be used to modify \LaTeX\ source files. However, it is important to ensure that the text editor saves the \LaTeX\ source files in the UTF-8 text encoding. A \LaTeX\ file saved in a different text encoding is likely to be either impossible to typeset or to produce unexpected output.

\textsuperscript{9} Overleaf fithesis3 templates are located at http://www.overleaf.com/gallery/tagged/muni.
\textsuperscript{10} \TeX\works\ can be downloaded from http://www.tug.org/texworks/.
2 Configuration

This chapter provides a full list of the settings that can be used to set up and customize the fithesis3 class.

2.1 Setting the class options

At the beginning of a fithesis3 \LaTeX source file, the command

\documentclass[option1, option2, ..., optionN]{fithesis3}

is used. The following list summarizes the options that are supported by the fithesis3 class and their meaning. Options that are enabled by default are *set in italics*.

digital This option sets the options that are the default for the digital version of a thesis. These options are *set in red*.

printed This option sets the options that are the default for the printed version of a thesis. These options are *set in blue*.

10pt, 11pt, 12pt These options set the font size of the main text to either 10 pt, 11 pt, or 12 pt, respectively. Using the 12 pt font size with the preset fonts should result in the optimal line width of approximately 66 characters in one-column typesetting. With two-column typesetting, the 10 pt font size is a better choice, yielding approximately the optimal 45 characters per line.

oneside This option enables one-sided typesetting. One-sided typesetting and printing is generally discouraged. Use only if you don’t have access to a double-sided printer, or if one-sided typesetting is a formal requirement at your faculty.

twoside This option enables double-sided typesetting. Double-sided typesetting is generally regarded as more visually pleasing and double-sided printing consumes less paper. Use at least 120 grams per square meter paper to prevent show-through.

*You may feel compelled to use twoside for the printed version of the thesis and oneside for the digital version to reduce the number
2. Configuration

of blank pages. This will, however, cause the page numbers to differ between the printed and the digital version, which will make it difficult to cite your work. Do not do it.

**onecolumn** This option causes the main text of the thesis to be set in one column.

**twocolumn** This option causes the main text of the thesis to be set in two columns. The two-column format is unconventional in theses; you should consult its use with your thesis advisor. If you decide to use the two-column format, remember that you also need to change the font size option (10pt, 11pt, 12pt).

**draft** This option replaces any images with blank rectangles and marks all overfull lines with black boxes. Other packages that you use may behave differently\(^1\) with the draft option specified. This can be useful, if you are going to print and proofread a draft of your document.

**final** Unlike the **draft** option, this option typesets the release version of the document.

**palatino** This option sets the roman text font family and the mathematical font family to Palatino.

**nopalatino** This option prevents fithesis3 from setting up the fonts. The user must set the fonts manually in the preamble of the document.

The Faculty of Informatics has licensed the Comenia font family. If you wish to use it in your thesis, you should contact Doc. RNDr. Petr Sojka, Ph.D.

If you are typesetting your thesis on a public-access computer at the Faculty of Informatics or on the aisa.fi.muni.cz Linux server, you can use the commercial Math Time mathematical font family, which goes well with the \(\text{T}_{\text{E}}\text{X} \text{Gyre Termes} \) text font family. To use Math Time and \(\text{T}_{\text{E}}\text{X} \text{Gyre Termes} \) within your thesis, the preamble of your document should look as follows:

\[ \text{1. For more information about the effects of the draft option on various packages, see } \text{http://tex.stackexchange.com/a/49369/70941}. \]

8
color  This option enables the use of colors. Note that all color definitions and colored logos are currently in rgb, which makes this option generally unsuitable for the printed version of the document. Although most printers will accept rgb documents, the resulting colors may not match what you see on screen. Unless you have a compelling reason not to, you should use this option in the electronic version that you are going to publish online.

monochrome  This option disables colors. Disabling colors is generally discouraged, unless you don’t have access to a color printer. However, due to the prevalence of monochrome printing, this option is the default.

microtype  This option sets up microtypographic extensions,\textsuperscript{2} which results in visually more pleasing paragraphs of text.

nomicrotype  This option prevents fithesis3 from setting up microtypographic extensions.

table  This option redefines some of the \LaTeX{} table environments (\texttt{tabular}, \texttt{tabularx}, and \texttt{tabu}) to use alternating colors for odd and even rows. This option only works, if the \texttt{color} option is enabled.

oldtable  This option instructs the style not to redefine any table environments.

lot  This option causes the list of tables to be included in the front matter of the thesis.

\textsuperscript{2}  For more information about the \LaTeX{} engine microtypographic extensions, see \url{http://mirrors.ctan.org/macros/latex/contrib/microtype/microtype.pdf}. 
2. Configuration

**nolot** This option removes the list of tables from the front matter of the thesis.

**lof** This option causes the list of figures to be included in the front matter of the thesis.

**nolof** This option removes the list of figures from the front matter of the thesis.

**cover** This option instructs the class to typeset the cover of the thesis on the first pages of the resulting document. A cover should be generally present in the electronic version of the document for completeness. The cover should not appear inside the printed document and should only serve as a template for the text imprinted on the front cover of the thesis cover.

**nocover** This option forbids the typesetting of the thesis cover. Use, if you are typesetting the printed version of a thesis and you are not going to have a cover made for your thesis.

### 2.2 Filling out the metadata

Beside the class options, you can also fill out information about your thesis by inserting the command

\begin{verbatim}
\thesissetup{
  key1 = \{value1\},
  key2 = \{value2\},
  ...
  keyN = \{valueN\},
}
\end{verbatim}

into the preamble of your thesis. The following list summarizes the keys and values that are recognized by the fitthesis3 class and are meaningful for the Faculty of Informatics.

**title** This key can be used to specify the title of the thesis. The value will be stored as one of the properties of the output PDF file; do not use any \LaTeX\ formatting commands within the value.
2. Configuration

TeXtitle This key can be used to specify the title of the thesis. The value will be typeset in the resulting pdf document, so you can use \LaTeX formatting commands within the value. If the value of the key is unspecified, the value of the title key will be used instead.

author This key can be used to specify the full name of the author.

keywords This key can be used to specify a list of keywords for your thesis. The value will be stored as one of the properties of the output pdf file; do not use any \LaTeX formatting commands within the value.

TeXkeywords This key can be used to specify a list of keywords for your thesis. The value will be typeset in the resulting pdf document, so you can use \LaTeX formatting commands within the value. If the value of the key is unspecified, the value of the keywords key will be used instead.

advisor This key can be used to specify the full name of the thesis advisor.

gender This key can be used to specify the gender of the author. It is used to determine the suffixes employed in the Czech and Slovak locales. If you are typesetting your document in English, you don’t need to specify this information. The valid values include:

m Male
f Female

type This key can be used to specify the type of the thesis. The recognized types of theses include:

bc Bachelor’s thesis
mgr Master’s thesis
prop Doctoral thesis proposal
d Doctoral thesis
r Rigorous thesis
2. Configuration

**faculty** This key can be used to set the faculty at which the thesis is going to be defended. To choose the Faculty of Informatics, use `fi` as the value.

**date** This key can be used to specify the date of the thesis submission in the `YYYY/MM/DD` format, where `YYYY` stands for the full year, `MM` stands for the month, and `DD` stands for the day of month.

**assignment** This key can be used to specify a list of pdf files containing the scanned thesis assignment. The list should be in the following format:

```
path/to/first/file.pdf, path/to/second/file.pdf, ...
```

**bib** This key can be used to specify a list of bib files containing the bibliography databases. The list should be in the following format:

```
path/to/first/file.bib, path/to/second/file.bib, ...
```

When this key is specified, the fithesis3 class will automatically typeset a bibliography section. If you want more control over where and how the bibliography is typeset, use the `\printbibliography[bibintoc]` command.

When this key is not specified, no bibliography will be produced, which provides the opportunity for the advanced user to set up their bibliography management manually.

**abstract** This key can be used to specify the abstract of the thesis.

**thanks** This key can be used to specify the text of the acknowledgements.

**declaration** This key can be used to specify the text of the declaration.

If the value of the key is unspecified, the following text is going to be used instead in the English locale: “Hereby I declare that

---

3. The bibliography will be typeset according to the ISO 690:2010 standard using the `biblatex-iso690` bibliography style. For more information, see [https://www.ctan.org/pkg/biblatex-iso690](https://www.ctan.org/pkg/biblatex-iso690).
2. Configuration

_This paper is my original authorial work, which I have worked out on my own. All sources, references, and literature used or excerpted during elaboration of this work are properly cited and listed in complete reference to the due source._”

The complete list of metadata keys can be found in Section 2.2 of the technical documentation of the fithesis3 class [7].
3 Advanced usage

This chapter contains a couple of tips for the advanced user, who may want to configure the class beyond what the class options and the metadata settings offer. An understanding of how the main routine of fithesis3 works is beneficial. The main routine is documented in Section 2.4 of the technical documentation of the fithesis3 class [7].

3.1 Troubleshooting option clashes

If you need to load a package with a specific set of options and the package happens to be required by the fithesis3 class, as specified in Section 1.1.2, you may experience an option clash error. If this error occurs, prepend \PassOptionsToPackage{options}{package} before the \documentclass[...]{fithesis3} command. If you need to configure the package, you can do that anywhere after the document preamble. If the package needs to be configured within the preamble, you can load the fithesis3 style files prematurely using the \thesisload command as follows:

\documentclass[...]{fithesis3}
%s The preamble
\thesisload
%s Here goes the package configuration.
\begin{document}
  % The document
\end{document}

Note that only a small portion of the packages loaded by fithesis3 is loaded with a specific set of options. The rest of the packages is lazy-loaded (loaded only if the user hasn’t already loaded them), in which case no clash is possible.

3.2 Overriding changes made by style and locale files

The fithesis3 style files are loaded immediately before the beginning of your document and may change values you would like to set by
3. Advanced usage

yourself, such as the \LaTeX\ tocdepth and seconumdepth counters. Locale files are also loaded immediately before your document, which prevents you from modifying locale strings from within the preamble of your document.

To overcome this limitation, you can load the style and locale files prematurely using the \texttt{thesisload} command as follows:

\begin{verbatim}
\documentclass[...]{fithesis3}
%% The preamble
thesisload
%% Here go your changes.
\begin{document}
  %% The document
\end{document}
\end{verbatim}

Although you may use the \texttt{thesisload} command anywhere in the preamble, using the command before configuring your metadata using the \texttt{thesissetup} command will load all the wrong style and locale files not taking into account your faculty and locale settings.

Another danger is that \texttt{thesisload} command loads the \texttt{hyperref} package, which adds hyperlinks and PDF metadata into the resulting PDF document. The hyperref package is rather delicate in that it needs to be loaded after most other packages. Loading additional packages after \texttt{thesisload} may therefore cause these packages to work incorrectly.

3.3 Changing the layout

If you are unsatisfied with the automatic arrangement of the mandatory parts of the thesis, you may disable it using the \texttt{autoLayout} metadata key:

\begin{verbatim}
\documentclass[...]{fithesis3}
\thesissetup{
  faculty=fi,
  autoLayout=false}
\begin{document}
  A document which, except for this line,
\end{document}
\end{verbatim}
3. Advanced usage

A document which, except for this line, is completely empty.

Figure 3.1: A document with disabled autoLayout

\begin{document}

This results in a document that only consists of the main matter of the thesis (see Figure 3.1). You can now manually insert the preamble and the postamble:

\documentclass[...]{fithesis3}
\thesissetup{
    faculty=fi,
    autoLayout=false}
\begin{document}
\makeatletter
\thesis@preamble
\makeatother
A document which once again contains all the mandatory parts of a thesis.
\makeatletter
\thesis@postamble
\makeatother
\end{document}

We are now back to the original document. Instead of inserting the \thesis@preamble and \thesis@postamble commands into the document, we may however insert only certain sections at the beginning and at the end of the document.

The \thesis@preamble and \thesis@postamble commands set up the proper environment and execute the \thesis@blocks@preamble and \thesis@blocks@postamble commands. To change the layout, it is sufficient to redefine the \thesis@blocks@preamble and \thesis@blocks@postamble commands.

To create a document that only contains the title page at the beginning of the document and the list of tables at the end of the document, we would use the following code:

\documentclass[...]{fithesis3}
\thesissetup{
    faculty=fi,
    autoLayout=false}
3. Advanced usage

\begin{document}
\makeatletter
\def\thesis@blocks@preamble{\thesis@blocks@titlePage}
\thesis@preamble
\makeatother
A document that only contains the title page and the list of tables.
\makeatletter
\def\thesis@blocks@postamble{\thesis@blocks@lot}
\thesis@postamble
\makeatother
\end{document}

The available blocks are documented in Section 3.5 of the technical documentation of the fithesis3 class [7].

3.4 Replacing the backend

Fithesis3 operates on top of the rapport3 class, which defines much of the document design. To change the backend class, you need to redefine the value of \thesis@backend from the default value of [a4paper]{rapport3}

to a different value. This assignment needs to be performed prior to the \documentclass command. If you wanted to change the backend class of fithesis3 to the KOMA-Script screprt with the a4paper option, your document would begin as follows:

\let\ChapFont\bfseries
\let\PageFont\bfseries
\makeatletter
\def\thesis@backend{[a4paper]{screprt}}
\makeatother
\documentclass[...]{fithesis3}
