ifnextok

\IfNextToken instead of \@ifnextchar

Does Not Skip Blank Spaces,

[and ‘\[’ may print bracket in new line]*

Uwe Lück†

June 27, 2011

Abstract

The ifnextok package deals with the behavior of \LaTeX's internal \@ifnextchar to skip blank spaces. This sometimes has surprising or for some users really unwanted effects, especially with brackets following \ when the user does not intend to specify an optional argument, rather wants that brackets are printed. The package offers commands and options for modifying this behavior, maybe limited to certain parts of the document source.

[It works!] It may also be useful with active characters in lieu of \, e.g., the double quote " with german.sty or babel

v0.3 fixes behavior in non-typesetting mode with \MakeNotSkipping, using a somewhat different technique than \LaTeX's robustifications.

Keywords: macro programming, optional command arguments, manual line breaks, humanities

Related packages: amsmath, mathtools

10 VERSION HISTORY 14
1 Installing and Calling

The package file ifnextok.sty is provided ready, installation only requires putting it somewhere where \TeX{} finds it (which may need updating the file-name data base).\footnote{http://www.tex.ac.uk/cgi-bin/texfaq2html?label=inst-wlcf}

Below the \documentclass line(s) and above \begin{document}, you load ifnextok.sty (as usually) by

\usepackage{ifnextok} or by \usepackage\[\langle\text{options}\rangle\]{ifnextok} —\langle\text{options}\rangle described in Section\footnote{http://www.tex.ac.uk/cgi-bin/texfaq2html?label=inst-wlcf} E.g., the main goal of writing the package is achieved by

\usepackage[stdbreaks]{ifnextok}

2 Header (Legalize)

3 Outline

The ifnextok package deals with the behavior of \LaTeX{}’s internal \texttt{\@ifnextchar} to skip blank spaces. This sometimes has surprising or for some users really unwanted effects, especially with brackets following \texttt{\textbackslash\textbackslash} when the user does not intend to specify an optional argument, rather wants that brackets are printed. The package offers commands and options for modifying this behavior, maybe limited to certain parts of the document source. They are described in the sections below together with the presentation of the implementation.
As after multiletter commands blank spaces are skipped anyway (\TeXbook p. 46f.), the package makes a \textit{difference only for one-symbol commands} such as \texttt{\textbackslash n}, or for \textit{active characters} such as the double quote with \texttt{german.sty} and \texttt{babel}. (v0.21: Or also \textit{optional arguments} following \textit{mandatory ones}—“trailing” \textit{optional arguments} mentioned by Lars Hellström and Bruno Le Floch on \LaTeX-L. v0.21a: Moreover, with “starred” \textit{command versions} having a first \textit{optional argument}!)

Similar things happen in \texttt{amsmath} and \texttt{mathtools}, and as of v0.21, we discuss relations to these packages.

A little \textbf{overview} of the package’s commands and options:

\section{For Macro Writers}

1. \texttt{\textbackslash IfNextToken} is an alternative to \texttt{\textbackslash ifnextchar}, not skipping spaces (Section 5.1). This macro is the \textit{low-level} backbone of all other modifications of \LaTeX\ commands.

2. \texttt{\textbackslash IfStarNextToken} is an alternative to \texttt{\textbackslash ifstar}, not skipping spaces, using \texttt{\textbackslash IfNextToken} in lieu of \texttt{\textbackslash ifnextchar} (Section 5.4).

3. Some “\textit{patching}” commands aim at modifying existing \texttt{\LaTeX} macros without specifying the resulting new definition explicitly (Sections 5.2 and 5.4). As a package writer, you just must know which macros need to be modified and specify their names as arguments for the patching macros.

4. There are low-level commands \texttt{\textbackslash INTstore} and \texttt{\textbackslash INTrestore} for undoing modifications of existing macros (Section 5.3).

\section{For End-Users}

There are \textbf{high-level} commands for modifying \texttt{\LaTeX} and selecting \texttt{\LaTeX} \textit{environments} to be affected (Section 6). Package \textbf{options} execute some of them (Section 7), e.g., [\texttt{stdbreaks}].

\section{Intermediate}

\texttt{\textbackslash MakeNotSkipping\{\langle target\rangle\}\{\langle on-space\rangle\}} described in Section 5.5 is somewhat “intermediate.” It acts on a document-level command \langle target\rangle without any assumptions about its internals. On the other hand, choosing \langle on-space\rangle for the new behavior of \langle target\rangle in front of a space token may need some knowledge . . .

(TODO: how command names are composed)
4 Caveats

1. Testing has not been very comprehensive so far. Usage together with \texttt{amsmath} may require special care or fail altogether.

2. Switching into “don’t-skip-spaces” mode \textit{two times} without switching back into normal mode in between won’t work with this version (v0.1–v0.3 \texttt{TODO}) of the package (\texttt{TODO}: permanent aliases). You will get the \texttt{Argument of ⟨patching⟩ has an extra ⟩} error. This also applies to commands that have been issued by package options.

3. Implementation may change much. (\texttt{TODO} 0.3)

5 For Making Macros

5.1 The Main Command \texttt{\textbackslash IfNextToken}

\texttt{\textbackslash IfNextToken\{match\}\{if\}\{else\}} is the obvious variant of \LaTeX’s internal \texttt{\@ifnextchar} executing \texttt{⟨if⟩} if actually the “very next” token is \texttt{⟨match⟩} and executing \texttt{⟨else⟩} otherwise. If \texttt{⟨match⟩} is not a space token (\LaTeX’s \texttt{\@sptoken}) but the next token is, \texttt{⟨else⟩} is executed; while \texttt{\@ifnextchar} tries matching the next token after ensuing space tokens.

\begin{verbatim}
\newcommand{\IfNextToken}[3]{%
    \let\nextok@match= #1%
    \let\nextok@if= #2\let\nextok@else= #3%
    \futurelet\@let@token\nextok@decide}
\end{verbatim}

... apart from using different names, this is the same as \texttt{\new@ifnextchar} in \texttt{amsgen.sty} of the \texttt{amsmath} bundle:

\begin{verbatim}
\long\def\new@ifnextchar#1#2#3{%
    \let\reserved@d= #1%
    \def\reserved@a{#2}\def\reserved@b{#3}%
    \futurelet\@let@token\new@ifnch
}
\end{verbatim}

... and the behavior is essentially the same ...
The analogue to our `\nextok@decide` in `amsmath/amsgen.sty` is `\new@ifnch`:

```
\def\new@ifnch{%
  \ifx\@let@token\reserved@d \let\reserved@b\reserved@a \fi
  \reserved@b
}
```

... and these two macros (`ifnextok`'s and `amsmath`'s) actually make the difference to Standard `\TeX`. The latter's `\@ifnch` tests for `\@sptoken` before looking for the actually wanted `\char`, `ifnextok` and `amsmath` don't. As to `\new@ifnch` vs. `\nextok@decide`, the first has one token less than the latter, but one assignment more. What does this mean? **TODO**

When I decided to create the `ifnextok` package, I was not aware of the similarity to `amsmath`, and I am not sure what I would have done had I ...

```
\NoNextSkipping now switches into “don’t-skip-spaces” mode “altogether”
(nevertheless ...):
```

```
\newcommand*{\NoNextSkipping}{\let\@ifnextchar\IfNextToken}
```

This appears so dangerous to me that I don’t want to support it much right now. `\RestoreNextSkipping` just switches back to `\TeX`'s original version, so some support for `amsmath` may be missing here.

```
\newcommand*{\RestoreNextSkipping}{%
  \let\@ifnextchar\kernel@ifnextchar}
```

Actually, because `\NoNextSkipping` does not affect `\kernel@ifnextchar`, those of `\TeX`'s commands using the latter still will skip spaces (with package version v0.1).

As opposed to `amsmath`, `ifnextok` aims at more choices as to what document-level commands are affected by the modified `\next` checking. Of course, `amsmath` deals with breaks between math display lines, while the present package rather was motivated by experiences in the humanities.

`\@sptoken` was discussed under ‘Some puzzling TeX’ on `texhax` in 2011 (February/May/June), and the matter is discussed in `The \TeX`book` in Exercise 24.6 and on pp. 376f.

### 5.2 “Bold” Patching Commands

`\INTpatch(replacer)(macro)` replaces something in the definition of `macro` according to the replacement macro `replacer`. This seems to work with the macros I thought of. It does not work when (for replacing `\@ifnextchar`) (a) there are `more` `\@ifnextchar`s in the macro to patch (outside braces), or when (b) the only `\@ifnextchar` is inside a pair of braces.

```
\newcommand*{\INTpatch}{2}{% 
  \expandafter\expandafter\expandafter 
  \expandafter\expandafter\expandafter \def
  \expandafter\expandafter\expandafter \expandafter\expandafter\expandafter #2% 
  \expandafter\expandafter\expandafter \expandafter\expandafter\expandafter {%
  \expandafter\expandafter\expandafter \expandafter\expandafter\expandafter #1#2})
```

%% red. 2011/06/24
\NextTestPatch(macro) replaces \@ifnextchar \@IfNextPatch by \IfNextPatch.

Another application of \INTPatch is \StarTestPatch in Section 5.4.

5.3 Storing and Restoring
\INTstore(macro) stores the meaning of the macro \langle macro \rangle in a special name space.

\newcommand*{\INTstore}[1]{{% \expandafter\let\csname\INT@save#1\endcsname#1}

In order to apply \MakeNotSkipping even to active characters below (v0.2), nothing must be gobbled from \string(token):

\newcommand*{\INTstore}{\INT.save\expandafter\@gobble\string}
\newcommand*{\INTstore}{\INT.save\string}

\INTrestore(macro) restores the meaning of \langle macro \rangle that is expected to have been stored with \INTstore:

\newcommand*{\INTrestore}[1]{{% \expandafter\let\expandafter#1\csname\INT@save#1\endcsname}

5.4 The Star Test
Before a \LaTeX line-break command tests for an optional argument, it tests for a star using \@ifstar, which in turn invokes \@ifnextchar. So already \@ifstar needs to be modified. We do not so much want to change \@ifstar altogether, rather we will replace it at some places by a non-skipping variant \IfStarNextToken\footnote{\textit{TODO} or \IfNextStar, cf. \IfNextSpace.} using the patching command \StarTestPatch(macro). \@ifstar has an argument and therefore cannot be patched as nicely as the line-break commands.)

\newcommand*{\IfStarNextToken}[1]{{\IfNextToken*{\@firstoftwo{#1}}}
\newcommand*{\StarTestPatch}{\INTpatch\nextok@starpatch}

The macro to be patched may contain a \par (\@centercr is an example), so we need \long:

\longdef\nextok@starpatch#1\@ifstar#1\IfStarNextToken

\StoreStarSkipping stores the current meaning of \@ifstar...
5 FOR MAKING MACROS

... so that it can be restored by \texttt{\RestoreStarSkipping}:

47 \texttt{\newcommand*{\RestoreStarSkipping}{\INTrestore@ifstar}}

\texttt{\NoStarSkipping} renders \texttt{@ifstar} non-skipping altogether:

48 \texttt{\newcommand*{\NoStarSkipping}{\let@ifstar\IfStarNextToken}}

This again seems to be so dangerous that it will not be supported much with package version v0.1 (by a package option).

On the other hand, \texttt{amsmath} (\texttt{amsgen.sty}) is not as scrupulous as we are and indeed redefines \texttt{@ifstar altogether}, equivalent to our \texttt{\NoStarSkipping}, except that the latter provides a method to restore. I.e., as soon as you have loaded \texttt{amsgen.sty} (invoked by any \texttt{amsmath} package), you have decided that a star appearing after whitespace is printed as a star, rather than choosing the ‘starred’ version of the respective command. What we actually find in \texttt{amsgen.sty} is

\texttt{\def@ifstar#1#2{\new@ifnextchar*{\def\reserved@a*{#1}\reserved@a}{#2}}} The \texttt{\reserved@a} trick seems to be due to \texttt{amsmath}’s idea of implementing the conditional (see the code we are quoting in Section 5.1).

5.5 More General Patching with \texttt{@sptoken}

This section deals with modifying macros by a more general technique than employed in Section 5.2. We do not use any knowledge of internals of the target user command (a “control symbol” like \ or an “active character”), and the command may take arguments, as the active double quote does with \texttt{german.sty} or \texttt{babel}.

5.5.1 \texttt{\IfNextSpace}

\texttt{\IfNextSpace{(if)}{(else)}} is an auxiliary macro that executes \texttt{(if)} if the next token is a space token (\LaTeX{}'s \texttt{@sptoken}), otherwise it executes \texttt{(else)}:

49 \texttt{\newcommand*{\IfNextSpace}{\IfNextToken@sptoken}}

This did not work with the v0.2 version of \texttt{\IfNextToken} that didn’t have ‘\texttt{=}’, due to \texttt{@sptoken} being an “implicit space token,” as Heiko Oberdiek pointed out on \texttt{texhax}. He also provided the remedy that actually was \texttt{amsmath}’s way

... v0.2 was:

\texttt{\newcommand*{\IfNextSpace}[2]{%
  \def\nexttok@if{#1}\def\nexttok@else{#2}%
  \futurelet\@let@token\nexttok@ifspace%
\newcommand*{\nexttok@ifspace}{%
  \ifx\@let@token@sptoken \expandafter \nexttok@if
  \else \expandafter \nexttok@else
  \fi}%}

... not so bad from an efficiency point of view, but ...—
5.5.2 \MakeNotSkipping

\MakeNotSkipping\{⟨target⟩\}\{⟨on-space⟩\} should modify ⟨target⟩ so that it acts in its usual way when no space token is ahead while executing ⟨on-space⟩ otherwise. E.g., ⟨target⟩ may be the active double quote " from babel, and on the left of a space token you want that the double quote just prints an ordinary double quote from the ligature ‘”’ (the first pair of argument braces may be omitted):

\MakeNotSkipping{"}{{}}

... while I don’t really recommend this right now (v0.2f.).

⟨target⟩, being on document level and probably appearing in moving arguments, must be robust, while \IfNextSpace is not. When ⟨target⟩ has been defined using \DeclareRobustCommand (\ from the document environment is an example), we would loose the original behavior of ⟨target⟩ if we used \DeclareRobustCommand ourselves.

v0.21 was horribly flawed at this point; I had not tested all cases, I had not studied how LATEX’s \DeclareRobustCommand handles control symbols (such as \_, see source.pdf), and my implementation did not obey the warning in my accompanying documentation ...

When ⟨target⟩ is a single (active) character, it may have been robustified by making it expand to a robust control sequence token, such as " via \nobreakspace{}—we don’t know, or don’t try to find out now. We make it robust, accepting that this may just introduce an unnecessary extra macro.

\newcommand*{\INT@modified}[1]{%
  \ifx\protect\@typeset@protect
    \expandafter\expandafter\expandafter \IfNextSpace
    \csname\INT@mod#1\expandafter\endcsname
  \else
    \protect#1%
  \fi}

\INT@mod⟨cs⟩ is another “name modifier”:

\newcommand*{\INT@mod}{\INT@mod.\string}

Here is the main command of the section. \@tempa will store the meaning of the command that ⟨target⟩ would call in typesetting mode after \DeclareRobustCommand⟨target⟩. \@tempb will store what ⟨target⟩ does in in typesetting mode, maybe that is just the meaning of ⟨target⟩ (kind of flag, like \if@tempswa):

\newcommand*{\MakeNotSkipping}[2]{%
  \expandafter \let \expandafter \@tempa
    \csname\expandafter\@gobble\string#1 \endcsname
  \let\@tempb#1%
}

When #1 is a control word, and its name, extended by a space, is the name of a defined token, we lazily (like \makerobust TODO) assume that its current
meaning was assigned by \texttt{\textbackslash DeclareRobustCommand}. One exception: if that token is the control space \texttt{\textbackslash \texttt{\textbackslash a}}n, \#1 is a single character (hopefully active, TODO check!!).

\begin{verbatim}
\ifx\@tempa\relax \else \ifx\@tempa\ \else
\let\@tempb\@tempa \fi \fi
\expandafter\let\csname\INT@save#1\endcsname\@tempb
\end{verbatim}

We have analyzed \#1 and now may modify it:

\begin{verbatim}
\def#1{\INT@modified#1}\
\end{verbatim}

We do not know beforehand what \texttt{(on-space)} will contain, in any case it should not be expanded right here, that’s why we use the token register \texttt{\textbackslash \texttt{@toks}}:

\begin{verbatim}
\toks@{#2}\
\expandafter\edef\csname\INT@mod#1\endcsname{\
{\the\toks@}\
\expandafter\noexpand\csname\INT@save#1\endcsname}\
\end{verbatim}

This still is experimental, and you must care not to apply the patch two times when it has not been undone in between. The main application may be a macro like \texttt{\textbackslash \textbackslash} that some (non-standard) environment defines; then you could redefine the environment so that its start finally modifies that macro according to your wishes. In the latter situation, the end of the environment will undo your \texttt{\textbackslash \texttt{\textbackslash MakeNotSkipping}};

\texttt{TODO: In the case of \textbackslash \textbackslash this might be a starting point for handling conventions about moving an ensuing punctuation mark to the left of the quotation mark. Moreover, getting something really useful would require dealing with " at the left of a bracket too.}

6 “Manual” Line Breaks

6.1 Outline of Implementation

In the first instance, the present package aims at rendering \texttt{\textbackslash \textbackslash} a command that interpretes a left-hand square bracket as a start of an optional argument only if the bracket is not preceded by any other token (apart from the star in \texttt{\textbackslash \textbackslash *}), especially not by a space token.

Indeed, an author may expect that when a bracket opens in a different line than the \texttt{\textbackslash \textbackslash}, then it will be \texttt{printed} rather than interpreted as an \texttt{optional-argument delimiter} (the package author has been such an author some times). Now, when the bracket only is in a line \texttt{following} the line carrying the \texttt{\textbackslash \textbackslash}, the end-line character normally produces a space token (\texttt{\TeX}book p. 47), so the present idea of implementation will cover the case of a bracket in the next line.

In \texttt{latex.ltx}, the names of the commands implementing the line break have some “pivot” part \texttt{(pivot)} that we can use to patch them in a uniform way. They
are two in each case: The first starts with \@\langle pivot \rangle and invokes \@ifstar, the second starts with \@\langle pivot \rangle and invokes the left-hand-bracket test. Both of them need to be patched.

### 6.2 “Normal” Manual Line Breaks

If I had been aware of the difficulties of this part, I probably would not have started writing this package, hoping it would be the work of about an hour.

\newline must be patched in order to get a non-skipping version of the bracket test, and this patch suffices for the optional-argument goal.

The \@ifstar call is in \@normalcr and its alias \@; the latter is invoked by \ according to \DeclareRobustCommand\.

Things seem to be easier when \ expands to \@normalcr instead of being an alias of it (CAUTION!). Then we just need to control \@normalcr:

\begin{verbatim}
\edef\backslashchar{\space}
\DeclareRobustCommand{\normalcr}{\backslashchar}
\end{verbatim}

\newcommand*{\StoreNewlineSkipping}{\INTstore\normalcr \INTstore\xnewline}

\newcommand*{\RestoreNewlineSkipping}{\INTrestore\normalcr \INTrestore\xnewline}

\newcommand*{\NoNewlineSkipping}{\StarTestPatch\normalcr \NextTestPatch\xnewline}

### 6.3 Manual Line Breaks in \LaTeX{} Environments

The macros in the present section should modify \LaTeX{}'s \ newline in environments \langle env \rangle being one of: \center, \tab, \array, and \tabular. These environment names are the expected arguments of those macros. However, argument \center also affects the \flushleft, \flushright and \verse environments, and \array and \tabular should also affect their enhanced variants from other \LaTeX{} packages. When this internal structure of \LaTeX{} changes, the present section may become obsolete . . .

\begin{verbatim}
\INTactOnEnv{{action1}}{(action2)}{(env)}
\end{verbatim}

is the backbone of these macros. \langle action1 \rangle and \langle action2 \rangle are one of \center, \tab, \array, \tabular.

\langle action1 \rangle deals with \@ifstar, \langle action2 \rangle deals with \@ifnextchar.

\textsuperscript{3}verse is provided by \LaTeX{}'s standard classes only, while flushleft and flushright belong to the \LaTeX{} kernel.
6.4 amsmath and mathtools

Just discussing related functionality in the amsmath and mathtools packages, without any own code:

amsmath modifies the star (*) test all over the document (see our Section 5.4), while providing own (not skipping) versions of \( \backslash \) rather in math displays and math environments only. This applies quite obviously to the \{cases\} and \{matrix\} environments. I am not sure about amsmath’s use of \textbackslash displaybreak, (cf. amstex.sty and the \textbackslash intertext command) and \textbackslash math@cr.

mathtools modifies amsmath’s line breaking behavior in turn on its options [allows] and [disallowspaces], referring to some strange behavior of amsmath. Still I don’t understand what is going on entirely, and my impression is that nobody else has understood these things entirely so far. mathtools is not the first package suppressing space skipping with \( \backslash \), amsmath has done this already; the question is where, where not, and why ... mathtools’s [disallowspaces] just seems to provide a more straightforward policy ... TODO
7 Package Options

7.1 Behavior without Options

If the package is called without any option, it only defines \IfNextToken, \IfStarNextToken and the other package-writer or user commands, without actually changing behavior of any \LaTeX command.

7.2 Option newline

Package option [newline] stores and disables space skipping for \textbackslash{n} in “normal” mode according to Section 6.2:

```
\DeclareOption{newline}{\StoreNewlineSkipping\NoNewlineSkipping}
```

7.3 Environments

The next package options are just the environment names according to Section 6.3 ([center] [tab] [array] [tabular]). Option \texttt{[env]} stores and disables the skipping behavior of \textbackslash{n} in \texttt{[env]} environments. We abuse the our temporary macro \texttt{\nextok@match} from Section 5.1:

```
\def\nextok@match#1{\csname ds@#1\endcsname}
\DeclareOption{#1}{\nextok@match{#1}\nextok@match{center}\nextok@match{tab}\nextok@match{array}\nextok@match{tabular}}
```

7.4 “All Options” or “Standard Options”

Package Options \texttt{all} and (v0.11:) \texttt{stdbreaks} have the same effect as using the newline option and the environment package options center, tab, array, and tabular at once.

```
\def\nextok@match#1{\csname ds#1\endcsname}
(... must not be changed before \ProcessOptions ...)
\DeclareOption{all}{%\nextok@match{newline}\nextok@match{center}\nextok@match{tab}\nextok@match{array}\nextok@match{tabular}}
```

Behavior of option \texttt{all} may change in the future of the package, while option \texttt{stdbreaks} should rather keep its present behavior.

```
\DeclareOption{stdbreaks}{\nextok@match{all}} \% v0.11
```
8 Processing Options and Leaving the Package

9 Acknowledgments

While I experienced the problem myself some years ago with a critical edition, I finally decided to do this work after postings by Susan Dittmar (March 2011) and Philipp Stephani (December 2010) on the \texttt{texhax} mailing list. The latter pointed to \texttt{mathtools}.

Moreover, the space skipping matter was discussed on the \texttt{LATEX-L} mailing list (‘xparse and space skipping’) in mid of May 2011, and the present package may be considered a contribution to that discussion (saying something like: keep the simple standard for beginners, offer something advanced for advanced users if you think some of them want it ... maybe just as \texttt{contrib}). Bruno Le Floch (May 11) and Frank Mittelbach (May 15) made me aware of the similar functionality in \texttt{amsmath}. Wordings in describing \texttt{ifnextok} may resemble wordings in that \texttt{LATEX-L} very much. Only for v0.21, I actually read these \texttt{LATEX-L} postings, rather than only their subject lines.

See sections 5.1 and 5.5 for Heiko Oberdiek’s contribution.
