This is the \texttt{lexikon} package. When I posted it to \texttt{de.comp.text.tex} some weeks ago it’s name was \texttt{dictionary.sty}. I changed it to fit into 8 charakters.

This package provides some commands which may be useful for a two language dictionary with addiional information for the keywords. There is only \texttt{lexikon.tex} as a documentation and it is in german but should be sufficient to line out the usage. If you need phonetic symbols you have to get the \texttt{ips.sty} and read the manual, I can’t help you with that.

This package is unsupported, but if you have an idea for an enhancement or find a bug just send me a mail. I’ll try to fix it but won’t spend many hours on the package because it already does what I need.

A database interface would be nice but will take some time. My first idea was to use Bib\TeX, but now i started using perl. I’m not sure It will ever be ready.

\footnote{This manual corresponds to \texttt{lexikon v0.1c}, dated 1999/05/13.}
