Tkz-linknodes

Tkz-linknodes.sty arose from a question of Philippe Ivaldi, about TikZ. It was a question of knowing if we could easily create links between the lines of an environment as \texttt{aligned} or still \texttt{align} by indicating the operation made between the two lines. With the Philippe's acute remarks and his active collaboration, I hope I can bring you a useful tool.

Firstly, I would like to thank Till Tantau for the beautiful LATEX package, namely TikZ.

I am grateful to Michel Bovani for providing the \texttt{fourier} font.

Finally, I would like to thank Herbert Voß for providing a very good document MathMode.pdf, I used some examples from it. You can find MathMode.pdf here: http://dante.ctan.org/indexes/info/math/voss/mathmode/

Vous trouverez de nombreux exemples sur mes sites : altermundus.fr ou altermundus.com

Please report typos or any other comments to this documentation to Alain Matthes This file can be redistributed and/or modified under the terms of the LATEX Project Public License Distributed from CTAN archives in directory CTAN://macros/latex/base/lppl.txt.

Here is an example of what Philippe wanted when he used the environment \texttt{aligned} \footnote{The \texttt{aligned} environment is similar to the array environment, there exists no starred version and it has only one equation number and has to be part of another math environment, which should be equation environment.}.

\begin{align*}
3\left(\frac{x^2 - \frac{2}{3}}{3}\right) &= 4 & \text{expand} \quad (1) \\
3x^2 - 2 &= 4 & \text{+2} \quad (2) \\
3x^2 &= 6 & \text{+3} \quad (3) \\
\text{isolate the term with the variable} & = & \text{so that} \quad (7) \\
\hspace{1cm} x^2 &= 2 & \sqrt{\cdots} \quad (4) \\
\sqrt{x^2} &= \sqrt{2} & \sqrt{x} = |x| \quad (5) \\
|x| &= \sqrt{2} & \quad (6) \\
\hspace{1cm} x = \pm \sqrt{2} & 
\end{align*}

\texttt{tkz-linknodes.sty} is based on \texttt{TikZ}, constituted by an environment \texttt{NodesList} and two macros \texttt{\AddNode} and \texttt{\LinkNodes}.

Philippe and I wanted a maximum of simplicity in the syntax and wish that it so stays even if developments occur. Without another word, it’s the simplicity itself.
2 Installation

2.1 How to install the package \texttt{linknodes.sty}

It is possible that when you will read this document, \texttt{tkz-tab} is present on the \texttt{CTAN} server. If \texttt{tkz-tab} is not still a part of your distribution, this chapter shows you how to install it.

2.2 With TeXLive under OS X and Linux

You could simply create a folder \texttt{prof} which path is: \texttt{texmf/tex/latex/prof}. \texttt{texmf} is generally the personal folder. For example the paths of this folder on my two computers are

- with OS X \texttt{/Users/ego/Library/texmf}.
- with Ubuntu \texttt{/home/ego/texmf}.

If you choose a custom location for your files, I suppose that you know why! The installation that I propose, is valid only for one user.

1. Store the file \texttt{tkz-linknodes.sty} in the folder \texttt{prof}.
2. Open a terminal, then type \texttt{sudo texhash}
3. Check that \texttt{xkeyval(\geq 2.5)} and \texttt{tikz 2.0} are installed.

My folder \texttt{texmf} is structured as in the diagram below because I use the \texttt{CVS} version of \texttt{Ti\kern.25mu kZ}. You don't need all the \texttt{pgf} folders.

![Diagram of TeXLive folder structure]

\texttt{tkz-tab} is not yet a part of \texttt{TeXLive} but it will be soon possible to install it with \texttt{tlmgr}.

You can find the \texttt{CVS} version here: \url{http://www.texample.net/tikz/builds/} without \texttt{CVS}

or here with CVS \url{http://sourceforge.net/projects/pgf/}

---

\footnote{\texttt{tkz-tab} is not still a part of \texttt{TeXLive} but it will be soon possible to install it with \texttt{tlmgr}}

\footnote{You can find the \texttt{CVS} version here: \url{http://www.texample.net/tikz/builds/} without \texttt{CVS}

or here with CVS \url{http://sourceforge.net/projects/pgf/}}
2.3 How to work with the tkz-\LaTeX-package under Windows?

Download and install the following files (if not yet done):

1. the \LaTeX-system MiKTeX from
   \[ \text{http://www.miktex.org/}. \]
   What file you need (e.g. \texttt{basic-miktex-2.7.2904.exe}) and how to install this program is explained there in the "Download" section of the respective version (current version is 2.7). In general and as usual in windows, you run the setup process by starting the setup file: (e.g. \texttt{basic-miktex-2.7.2904.exe}).

2. Till Tantau's \LaTeX-package pgf-tikZ from
   \[ \text{http://sourceforge.net/projects/pgf/}. \]
   "For MiKTeX, use the update wizard [of MiKTeX] to install the (latest versions of the) packages called pgf, xcolor, and xkeyval." (cited from the pgf manual, contained in the files downloaded).

3. the sty-files and the doc-files of Alain's tkz-package from
   \[ \text{http://www.altermundus.fr/pages/download.html}. \]
   or \[ \text{http://altermundus.com/pages/download.html}. \]
   To add the files to MiKTeX:
   - add a directory \texttt{prof} in the directory [MiKTeX-dir]/tex/latex', e.g. in windows explorer,
   - copy the sty-files in this directory \texttt{prof},
   - update the MiKTeX system, ether by running in a DOS shell the command "\texttt{mktexlsr -u}"
     or by clicking "Start/Programs/Miktex/Settings/General", then push the button "Refresh FNDB".
How to use the package linknodes.sty

You can compile with pdflatex but you have to compile your document twice! It’s possible to compile with latex but only if the version of pdftex is equal to or greater than 1.40.

The package loads, tries to load xkeyval[2005/11/25], tikz[2007/06/07] version 2.00, amsmath, etex and ifthen.

3.1 Minimal example but complete

\begin{document}
\begin{NodesList}
\begin{aligned}
2x &= 8 \AddNode \\
x &= 4 \AddNode
\end{aligned}
\LinkNodes{$\div 2$}
\end{NodesList}
\end{document}

3.2 Result

\begin{equation}
2x = 8 \hspace{2cm} x = 4 + 2
\end{equation}
4 Essential environment \texttt{NodesList} and macros \texttt{\LinkNodes} and \texttt{\AddNode}

\section{4.1 The environment \texttt{NodesList}}

\begin{NodesList}[(options)] (environment contents) \end{NodesList}

\begin{itemize}
\item \textbf{options} default definition
\item \textbf{margin} 2cm right margin
\item \textbf{dy} 1.5pt $2 \times dy$ is the space between two adjacent arrows on the same node.
\end{itemize}

The use of this environment is obligatory. It admits options which we are going to detail in the following examples. These options are not obligatory and the values by default are given in the table above.

\section{4.2 The command \texttt{\AddNode}}

\AddNode[(options)]

\begin{itemize}
\item \textbf{options} default definition
\item \textbf{number} 1 It defines to which group belongs this node
\end{itemize}

An optional argument is possible, thus placed between hooks if it is present, and it is an integer superior to 1. It defines to which group belongs this node.

This macro allows to ask that a link can leave or arrive of the node which we have just created. Really, it is not a node, I would say rather an anchor either another a reference point.

A group is a set of links (arrows). The origin of the one is the extremity of the precedent. The first group is noted 1 which is the value by default.

\section{4.3 The command \texttt{\LinkNodes}}

\LinkNodes[(options)]{(expression)}

\begin{itemize}
\item \textbf{options} default definition
\item \textbf{margin} 2 cm right margin
\item \textbf{dy} 1.5 pt $2 \times dy$ is the space between two adjacent arrows on the same node.
\end{itemize}

This macro allows the representation of the link between nodes and the label the contents of which are "expression" placed on this link. These links are created by following the order of their creation.

The style of these links is determined by the default following styles:

\begin{itemize}
\item \texttt{\tikzset{ArrowStyle/.style={>=latex,->,text=black}}}
\item \texttt{\tikzset{LabelStyle/.style={pos=0.25,right}}}
\end{itemize}
\begin{NodesList}
\begin{align}
\boxed{ 3(x^2-3) = 4 } & \AddNode \\
 x^2-3 = \frac{4}{3} & \AddNode \\
\text{isolate the term with the variable } x^2 & = \frac{13}{3} \AddNode \\
\sqrt{x^2} & = \sqrt{\frac{13}{3}} \AddNode \\
|x| & = \sqrt{\frac{13}{3}} \AddNode \\
x & = \pm \sqrt{\frac{13}{3}} \AddNode \\
& +3 \\
& \div 3 \\
& +3 \\
& \sqrt{\ldots} \\
& \sqrt{x^2} = |x| \\
& \text{we have two answers} \\
\end{align}
\end{NodesList}

5.1 The code of the first example

Let us see first of all, the example of the introduction but placed in a more general frame, that of a page A4. Four nodes are created at the end of every line, then three links, both first ones have a personalized margin.

The environment \texttt{aligned} is placed in an environment \texttt{displaymath} that is "in display mathematical mode". It means that the equations are placed in a box having the width of the page and that the sign equals is situated in the center of a line.
5.2 With the environment \texttt{minipage}

That the environment \texttt{NodesList} makes exactly. It tracks down the width of the line of the page which goes the receive here this width is the width of the text because we are in a display mathematical mode. The example of the introduction is placed in an environment \texttt{minipage} of \LaTeX, thus the width will be the one attributed to minipage.

Then, it prepares a list of counters to attribute automatically names to the nodes that the user will have placed with the macro \texttt{\AddNode}. The macro \texttt{\LinkNodes} represents a link between two successive nodes.

5.2 With the environment \texttt{minipage}

Thus we go to see what arrives at our environment in the case of an environment \texttt{minipage}. In that case the width of the page is given by \texttt{minipage}. The result can be seen below, we need to modify the last margin :

\begin{center}
\fbox{egin{minipage}{12cm}
\begin{NodesList}
\begin{displaymath}
\begin{aligned}
3(x^2-3) &= 4 \AddNode \\
x^2-3 &= \frac{4}{3} \AddNode \\
x^2 &= \frac{13}{3} \AddNode \\
\sqrt{x^2} &= \sqrt{\frac{13}{3}} \AddNode \\
|x| &= \sqrt{\frac{13}{3}} \AddNode \\
x &= \pm \sqrt{\frac{13}{3}} \AddNode
\end{aligned}
\end{aligned}
\end{displaymath}
\LinkNodes[margin=4 cm]{$\div 3$}
\LinkNodes[margin=3 cm]{$+3$}
\LinkNodes{$\sqrt{\ldots}$}
\end{NodesList}
\end{minipage}}
\end{center}

\begin{verbatim}
\documentclass[]{article}
\usepackage[utf8]{inputenc} % My favorite encoding but not indispensable.
\usepackage[upright]{fourier} % My favorite font.
\usepackage{LinkNodes}
\begin{document}
\begin{center}
\fbox{\begin{minipage}{12cm}
\begin{NodesList}
\begin{displaymath}
\begin{aligned}
3(x^2-3) &= 4 \AddNode \\
x^2-3 &= \frac{4}{3} \AddNode \\
x^2 &= \frac{13}{3} \AddNode \\
\sqrt{x^2} &= \sqrt{\frac{13}{3}} \AddNode \\
|x| &= \sqrt{\frac{13}{3}} \AddNode \\
x &= \pm \sqrt{\frac{13}{3}} \AddNode
\end{aligned}
\end{aligned}
\end{displaymath}
\LinkNodes[margin=4 cm]{$\div 3$}
\LinkNodes[margin=3 cm]{$+3$}
\LinkNodes{$\sqrt{\ldots}$}
\end{NodesList}
\end{minipage}}
\end{center}
\end{document}
\end{verbatim}
6.1 One link between the first two lines

I take the same example and I try to modify it. I want only the first link so I create only two nodes and one link.

\begin{NodesList}
\begin{displaymath}
\begin{aligned}
3(x^2 - 3) &= 4 \AddNode \\
x^2 - 3 &= \frac{4}{3} \AddNode \\
x^2 &= \frac{13}{3} \\
\sqrt{x^2} &= \sqrt{\frac{13}{3}} \\
|x| &= \sqrt{\frac{13}{3}} \\
x &= \pm \sqrt{\frac{13}{3}}
\end{aligned}
\end{displaymath}
\LinkNodes{$\div 3$}
\end{NodesList}

6.2 One link between the last two lines

\begin{NodesList}
\begin{displaymath}
\begin{aligned}
3(x^2 - 3) &= 4 \\
x^2 - 3 &= \frac{4}{3} \\
x^2 &= \frac{13}{3} \\
\sqrt{x^2} &= \sqrt{\frac{13}{3}} \\
|x| &= \sqrt{\frac{13}{3}} \\
x &= \pm \sqrt{\frac{13}{3}}
\end{aligned}
\end{displaymath}
\end{NodesList}
6.3 How to create a new group

We saw how having a link on the first nodes, as well as on the last ones, now here is an example to have a link on the first and the last nodes.

The principle is simple. The argument 2 indicates that we create another chain of links. It was already present but 1 is optional. The arguments must be created in increasing order.

\[
\begin{aligned}
3(x^2-3) &= 4 \\
& \quad \text{AddNode} \\
x^2-3 &= \frac{4}{3} \\
& \quad \text{AddNode} \\
x^2 &= \frac{13}{3} \\
\sqrt{x^2} &= \sqrt{\frac{13}{3}} \\
|x| &= \sqrt{\frac{13}{3}} \\
x &= \pm \sqrt{\frac{13}{3}}
\end{aligned}
\]

6.4 Two groups on the same line

We can also do that.
\begin{align*}
\quad x^2 - 4 &= 0 \\
(x-2)(x+2) &= 0 \\

\begin{aligned}
\hline
\text{first factor is null} \quad x-2 &= 0 \\
\hline
\text{Or second factor is null} \quad x+2 &= 0 \\
\end{aligned}
\end{align*}

\begin{minipage}{10cm}
\begin{NodesList}[margin=-2cm]
\begin{align}
\left\{ \begin{aligned}
d_n &= 400 - \frac{v_n}{3} \hfill \\
v_n &= 0.8v_{n-1} + 0.2d_n + 9.6 \\
\end{aligned} \right. \\
\text{$v_n$ and $d_n$ are dependent}
\end{align}
\end{NodesList}
\end{minipage}

You can try this example without \hfill at line 5.
These options are among two, \texttt{margin} and \texttt{dy}. They are useful globally at the level of the environment \texttt{NodesList} either locally at the level of the macro \texttt{\LinkNodes}.

### 7.1 Option margin

First of all, let us remind that the default margin is 2 cm. It is represented by the red arrow on the following figure. The margin is defined from the right edge of the box which begins the environment.

It is necessary to notice that the box of the introduction is slightly different from this one. Indeed, the macro \texttt{\fbox} adds a space around its equal contents in \texttt{\fboxsep}. This one was put in zero for the occasion.

### 7.2 Equal margins

I suppose that you understood that the option \texttt{margin} of the macro \texttt{\LinkNodes} plays the same role as that of the environment. So having deleted them, I choose a margin of 3 cm as everybody. This time with regard to the edge of the text field of the page.
7.3 Negative margins

Yes we can! The example is from MathMode.pdf In this example, I use \textwidth

\begin{align*}
y &= 2x^2 - 3x + 5 \quad \text{is the beginning of an algebraic identity (binomial formula)} \\
&= 2 \left( x^2 - \frac{3}{2}x + \left(\frac{3}{4}\right)^2 \right) - \left(\frac{3}{4}\right)^2 + \frac{5}{2} \quad \text{(a \text{-} b)^2 = a^2 - 2ab + b^2} \\
&= 2 \left( x - \frac{3}{4} \right)^2 + \frac{31}{16} \\
y &= 2 \left( x - \frac{3}{4} \right)^2 + \frac{31}{8}
\end{align*}

2x^2 - 3x is the beginning of an algebraic identity (binomial formula)

\begin{tikzpicture}[baseline=(current bounding box.center)]
\node (a) at (0,0) {$y = 2x^2 - 3x + 5$};
\node (b) at (1.5,0) {$= 0$};
\node (c) at (3,0) {$2x^2 - 3x$ is the beginning of an algebraic identity (binomial formula)};
\node (d) at (4.5,0) {after simplification, the result is};
\end{tikzpicture}
7.4 The general option dy

Here, it is a question of adjusting the distance between two arrows. The distance is equal in $2 \times dy$

\[
3(x^2 - 3) = 4 \\
\frac{x^2 - 3}{3} = \frac{4}{3} \\
x^2 = \frac{13}{3} \\
\sqrt{x^2} = \sqrt{\frac{13}{3}} \\
|x| = \sqrt{\frac{13}{3}} \\
x = \pm \sqrt{\frac{13}{3}}
\]

Modification of the style

It is enough for it to modify either \{ArrowStyle\}, or \{LabelStyle\}. By default, the values are the following ones

8.1 Adding some style

At first, the shape of the arrow is modified as well as its color. For other forms of arrow, see the documentation on the \texttt{pgfmanual}.

Then the place of the label is modified with \texttt{pos=0.75}. \texttt{pos=0} corresponds to the superior corner, \texttt{pos=0.25} in the middle of the vertical line. We can then adjust the position of the node, here \texttt{above} is used. For other adjustments, see \texttt{pgfmanual} or the following examples.

\[
2x = 8 \\
x = 4
\]
8.2 Modification of the text color

Since styles are just special cases of pgfkeys’s general style facility, you can actually do quite a bit more. Let us start with adding options to an already existing style. This is done using /append style instead of /style:

```
append style allows to take back the values of the style LabelStyle by adding the color red in the text which replaces the old color. Note that two colors are set, so the last one will “win.”
```

![Diagram](attachment:diagram.png)

8.3 Modification of the text position

You need to read the paragraph of pgfmanual "Basic Placement Options". You can use left, right, above and below but also something like above right or left = 2 cm.

![Diagram](attachment:diagram.png)

4 Another possibility is \LinkNodes\textcolor{orange}{$\div 2$}
8.4 Boxed text

A little more sophisticated: \texttt{draw} allows to frame, \texttt{right=10pt} allows to move away a little the label, \texttt{green} defines the color of the line, \texttt{fill=green!30} defines the color of filling and finally the color of the text is red.

\begin{NodesList}
\begin{aligned}
2x &= 8 \AddNode \\
x &= 4 \AddNode \\
\end{aligned}
\end{NodesList}

SECTION 9

Some more complex examples

9.1 Solution of two simultaneous equations.

Solution of two simultaneous equations. The problem is to find the set of all solutions that satisfies both equations. These are called simultaneous equations.
9.1 Solution of two simultaneous equations.

\[
\begin{align*}
3x + 4y &= 10 \\
2x + y &= 5
\end{align*}
\]

both sides of second equation are multiplied by 4

\[
\begin{align*}
3x + 4y &= 10 \\
8x + 4y &= 20
\end{align*}
\]
The first equation is subtracted from second

\[
\begin{align*}
3x + 4y &= 10 \\
5x &= 10
\end{align*}
\]
As a result, \( x = 2 \), this value is then substituted in the first equation

\[
\begin{align*}
3(2) + 4y &= 10 \\
x &= 2
\end{align*}
\]
6 is subtracted from both sides

\[
\begin{align*}
4y &= 10 - 6 \\
x &= 2
\end{align*}
\]
As a result, \( y = 1 \)

The solution is \( (x = 2 ; y = 1) \)
This example is more complex because the environments are nested.
9.3 One environment and two groups

\begin{aligned}
\left. \begin{aligned}
x^2 - 4 &= 0 \\
(x - 2)(x + 2) &= 0 \\
x - 2 &= 0 \\
x &= 2 \\
x + 2 &= 0 \\
x &= -2 \\
\end{aligned} \right\}
\end{aligned}

One of the factors is null

\text{factorisons}

3 \left( x^2 - \frac{2}{3} \right) = 4
\quad \text{expand} \quad (14)

3x^2 - 2 = 4
\quad \text{expand} \quad +2
\quad \text{expand} \quad (15)

3x^2 = 6
\quad \text{expand} \quad (16)

x^2 = 2
\quad \text{expand} \quad (17)

\sqrt{x^2} = \sqrt{2}
\quad \text{expand} \quad \sqrt{x} = |x| \quad (18)

|x| = \sqrt{2}
\quad \text{expand} \quad (19)

x = \pm \sqrt{2} \quad \text{expand} \quad (20)
\begin{align*}
3\left(x^2-\frac{2}{3}\right) &= 4 & \text{AddNode} \\
3x^2-2 &= 4 & \text{AddNode} \\
3x^2 &= 6 & \text{AddNode} \\
x^2 &= 2 & \text{AddNode} \\
\sqrt{x^2} &= \sqrt{2} & \text{AddNode} \\
|x| &= \sqrt{2} & \text{AddNode} \\
x &= \pm\sqrt{2}
\end{align*}
\begin{NodesList}[margin=0.5cm]
\begin{displaymath}
\begin{aligned}
x^2 - 4 &= 0 \
(x - 2)(x + 2) &= 0 \
\hline
x - 2 &= 0 \\
\quad & \Rightarrow x = 2 \\
\hline
x + 2 &= 0 \\
\quad & \Rightarrow x = -2 \\
\end{aligned}
\end{aligned}
\end{displaymath}
\end{NodesList}
Label with \texttt{minipage}

You can see in this example how to define a style if you want to place correctly a "\texttt{minipage}".

\[ x^2 - 4 = 0 \quad \text{The first member can be factored as} \]
\[(x - 2)(x + 2) = 0 \]
\[
x - 2 = 0 \\
x = 2 \\
x + 2 = 0 \\
x = -2 \]

\begin{minipage}{4cm}
If the product of any two numbers is zero, then one or both of the numbers is zero
\end{minipage}
Three groups and few environments aligned

It is interesting to notice the use of \texttt{displaywidth} which allows in display mathematical mode to modify the placement with regard to the left margin.

Solve in $\mathbb{R}$: \[
\frac{2}{3} - 3x \left( \frac{3}{5} + 2x \right) = 0
\]

\[
\begin{align*}
\frac{2}{3} - 3x &= 0 \\
ou &\quad \times 3 \\
3 + 2x &= 0 \\
\end{align*}
\]

\[
\begin{align*}
2 - 9x &= 0 \\
ou &\quad \times 5 \\
3 + 10x &= 0 \\
\end{align*}
\]

\[
\begin{align*}
2 = 9x &\quad + 3 \\
ou &\quad +9 \\
10x &= -3 \\
\end{align*}
\]

\[
\begin{align*}
x &= \frac{2}{9} \\
ou &\quad +10 \\
x &= \frac{-3}{10}
\end{align*}
\]

If the product of any two numbers is zero, then one or both of the numbers is zero.

On the next page, the code looks like:
\begin{NodesList}
\begin{displaymath}
\text{\left(} \frac{2}{3}-3x \text{\right)} \text{\left(} \frac{3}{5}+2x \text{\right)}=0
\end{displaymath}
\begin{aligned}
\text{\Leftarrow}&&
\begin{aligned}
\text{\left\{\begin{aligned}
\frac{2}{3}-3x&=0 \\
\text{ou}&& \\
\frac{3}{5}+2x&=0
\end{aligned}\right.}
\text{\Rightarrow}&&
\begin{aligned}
\text{\left\{\begin{aligned}
2-9x&=0 \\
\text{ou}&& \\
10x&=-3
\end{aligned}\right.}
\end{aligned}
\end{aligned}
\end{aligned}

\textcolor{red}{\textbf{If the product of any two numbers is zero, then one or both of the numbers is zero.}}
\end{NodesList}

10 How to use `tkz-linknodes.sty` with `align`

SECTION 10

How to use `tkz-linknodes.sty` with `align`

10.1 With align et minipage

With this environment, we are directly in the display math mode and the lines are numbered.

This environment is very useful and I recommend you to see the examples in MathMode.tex of Herbert Voß.

\[
\begin{align}
&3 \left( x^2 - \frac{2}{3} \right) = 4 \quad \text{expand} \\
&3x^2 - \frac{2}{3} = 4 \quad \text{+2} \\
&3x^2 = 6 \quad \text{+3} \\
&x^2 = 2 \quad \sqrt{\ldots} \\
&\sqrt{x^2} = \sqrt{2} \\
&|x| = \sqrt{2} \\
&x = \pm \sqrt{2}
\end{align}
\]

\begin{minipage}{12cm}
\begin{NodesList}[margin=4cm]
\begin{align}
3 \left( x^2 - &\frac{2}{3} \right) = 4 \AddNode \\
3x^2 - &\frac{2}{3} = 4 \AddNode \\
3x^2 = &6 \AddNode \\
x^2 = &2 \AddNode \\
\sqrt{x^2} = &\sqrt{2} \AddNode \\
|x| = &\sqrt{2} \AddNode \\
x = &\pm \sqrt{2}
\end{align}
\LinkNodes{expand}
\LinkNodes{+2}
\LinkNodes{+3}
\LinkNodes{\sqrt{\ldots}}
\LinkNodes{\sqrt{x}=|x|}
\end{NodesList}
\end{minipage}
10.2 With \texttt{align*}

\begin{NodesList}[margin=4 cm]
\begin{align*}
3 \left( x^2 - \frac{2}{3} \right) &= 4 & \text{expand} \\
3x^2 - 2 &= 4 & +2 \\
3x^2 &= 6 & +3 \\
x^2 &= 2 & \sqrt{\ldots} \\
\sqrt{x^2} &= \sqrt{2} & \sqrt{x} = |x| \\
|x| &= \sqrt{2} & \\
x &= \pm \sqrt{2}
\end{align*}
\end{NodesList}

10.3 With \texttt{align} and \texttt{nonumber}

\begin{NodesList}[margin=4 cm]
\begin{align*}
3 \left( x^2 - \frac{2}{3} \right) &= 4 & \text{expand} \\
3x^2 - 2 &= 4 & +2 \\
3x^2 &= 6 & +3 \\
x^2 &= 2 & \sqrt{\ldots} \\
\sqrt{x^2} &= \sqrt{2} & \sqrt{x} = |x| \\
|x| &= \sqrt{2} & \\
x &= \pm \sqrt{2}
\end{align*}
\end{NodesList}
11 How to use \texttt{tkz-linknodes.sty} with \texttt{array}

\begin{NodesList}[margin=4 cm]
\begin{align}
3\left(x^2-\frac{2}{3}\right) &= 4 \\
3x^2-2 &= 4 \\
x^2 &= 2 \\
\sqrt{x^2} &= \sqrt{2} \\
|x| &= \sqrt{2} \\
x &= \pm\sqrt{2}
\end{align}

\section{11}

\subsection{With array an example from Mathmode.tex}

\begin{minipage}{11cm}
\begin{array}{ll}
x^2+2x & \text{if } x<0, \\
x^3 & \text{if } 0 \leq x < 1, \\
x^2+x & \text{if } 1 \leq x < 2, \\
x^3-x^2 & \text{if } 2 \leq x.
\end{array}
\end{minipage}
11.2 An example from Mathmode.tex

In this example, we use an environment \texttt{minipage} in the label.

\begin{NodesList}[margin=0cm]
\begin{array}{@{}r@{\quad}ccrr@{}}
\texttt{a}) & y & = & c & (constant) \\
\texttt{b}) & y & = & cx+d & (linear) \\
\texttt{c}) & y & = & bx^2+cx+d & (square) \\
\texttt{d}) & y & = & ax^3+bx^2+cx+d & (cubic) \\
\end{array}
\end{NodesList}

Here are the various studied cases

\begin{Verbatim}
\begin{NodesList}[margin=0cm]
\begin{array}{@{}r@{\quad}ccrr@{}}
\texttt{a}) & y & = & c & (constant) \\
\texttt{b}) & y & = & cx+d & (linear) \\
\texttt{c}) & y & = & bx^2+cx+d & (square) \\
\texttt{d}) & y & = & ax^3+bx^2+cx+d & (cubic) \\
\end{array}
\end{NodesList}
\end{Verbatim}
11.3 An example from Mathmode.tex

\begin{NodesList}
\begin{array}{rcll}
y & = & x^2 + bx + c & \\[\]
& = & x^2 + 2 \cdot \frac{b}{2} x + c & \\[\]
& = & x^2 + 2 \cdot \frac{b}{2} x + \left( \frac{b}{2} \right)^2 - \left( \frac{b}{2} \right)^2 + c & \\[\]
y + \left( \frac{b}{2} \right)^2 - c & = & \left( x + \frac{b}{2} \right)^2 - c & \\[\]
y - y_S & = & (x - x_S)^2 & \\[\]
S(x_S; y_S) \text{ soit } S \left( -\frac{b}{2}; \left( \frac{b}{2} \right)^2 - c \right)
\end{array}
\end{NodesList}

\begin{NodesList}
\begin{array}{rcll}
y & = & x^2 + bx + c & \\[\]
& = & x^2 + 2 \cdot \frac{b}{2} x + c & \\[\]
& = & x^2 + 2 \cdot \frac{b}{2} x + \left( \frac{b}{2} \right)^2 - \left( \frac{b}{2} \right)^2 + c & \\[\]
y + \left( \frac{b}{2} \right)^2 - c & = & \left( x + \frac{b}{2} \right)^2 - c & \\[\]
y - y_S & = & (x - x_S)^2 & \\[\]
S(x_S; y_S) \text{ soit } S \left( -\frac{b}{2}; \left( \frac{b}{2} \right)^2 - c \right)
\end{array}
\end{NodesList}

\begin{NodesList}
\begin{array}{rcll}
y & = & x^2 + bx + c & \\[\]
& = & x^2 + 2 \cdot \frac{b}{2} x + c & \\[\]
& = & x^2 + 2 \cdot \frac{b}{2} x + \left( \frac{b}{2} \right)^2 - \left( \frac{b}{2} \right)^2 + c & \\[\]
y + \left( \frac{b}{2} \right)^2 - c & = & \left( x + \frac{b}{2} \right)^2 - c & \\[\]
y - y_S & = & (x - x_S)^2 & \\[\]
S(x_S; y_S) \text{ soit } S \left( -\frac{b}{2}; \left( \frac{b}{2} \right)^2 - c \right)
\end{array}
\end{NodesList}
12.1 With \texttt{gather}

A little modified example from Mathmode.tex

\begin{center}
\fbox{
\begin{minipage}{14cm}
\begin{NodesList}
\begin{gather}
3(x^2 - 3) = 4 \quad \text{(33)}
\end{gather}
\AddNode{}
\begin{gather}
x^2 - 3 = \frac{4}{3} \quad \text{(34)}
\end{gather}
\AddNode{}
\intertext{isolate the term with the variable}
\begin{gather}
x^2 = \frac{13}{3} \quad \text{(35)}
\end{gather}
\AddNode{}
\begin{gather}
\sqrt{x^2} = \sqrt{\frac{13}{3}} \quad \text{(36)}
\end{gather}
\AddNode{}
\begin{gather}
|x| = \sqrt{\frac{13}{3}} \quad \text{(37)}
\end{gather}
\AddNode{}
\begin{gather}
x = \pm \sqrt{\frac{13}{3}} \quad \text{(38)}
\end{gather}
\AddNode{}
\end{NodesList}
\end{minipage}
}\end{center}
12.2 With \texttt{gather*} and \texttt{align*}

An example from Mathmode.tex

\begin{minipage}{\linewidth-7pt}
\begin{NodesList}
\begin{align*}
m_2 &= m_2' + m_2'' \AddNode \\&
\Rightarrow m_2 v_2' = V - V_2'' + V_2'' \frac{v_2'}{v_2''} \AddNode \\
&= \frac{V_2'}{v_2'} + \frac{V_2''}{v_2''} \AddNode \\
\end{align*}
\end{NodesList}
\end{minipage}

\noindent\LinkNodes{(i)} \LinkNodes{(ii)} \LinkNodes{(iii)}
12.3 With enumerate

This example shows that we can use the environment \texttt{NodesList} with a list \texttt{enumerate}

1. A \hspace{1cm} \texttt{Liberté}
2. B \hspace{1cm} \texttt{Égalité}
3. C \hspace{1cm} \texttt{Fraternité}
4. D

\begin{NodesList}[margin=7cm]
\item \texttt{A} \AddNode
\item \texttt{B} \AddNode
\item \texttt{C} \AddNode
\item \texttt{D} \AddNode
\end{NodesList}

12.4 With \texttt{flalign}

Another example from Mathmode.tex

\begin{NodesList}
\begin{flalign}
x &= 2 \quad \text{if } y > 2 \AddNode & \\
x &= 3 \quad \text{if } y \leq 2 \AddNode &
\end{flalign}
\end{NodesList}

\begin{tikzpicture}[ArrowStyle/.append style = {<->,red}]
\begin{scope}[LabelStyle/.append style = {left,text=blue}]
\LinkNodes{Two cases are to be studied}
\end{scope}
\end{tikzpicture}
### With listings

```c
void example(FILE *fp)
{
    int c;

    while((c=fgetc(fp)!=EOF))
        if(c=='X')
            goto done;
        fputc(c,stdout);
}

done:
    exit(0);
}
```

---

**Beamer and tkz-linknodes**

The next example is from **Guillaume Connan**. The first thing you can notice about this code is the multiple nodes from the first line.

```latex
\documentclass[xcolor={usenames,pdftex,dvipsnames,table},10pt]{beamer}
\usepackage[utf8]{inputenc}
\usepackage{lmodern}
\usepackage[upright]{fourier}
\usepackage{tikz}
\usepackage{amsmath,calc}
\usepackage{tkz}
\usepackage{amsmath,calc}
\usepackage{tkz-linknodes}
\usetikzlibrary{arrows,shapes}
\newcommand{\vtab}{\rule[-1.2em]{0pt}{3em}}
\begin{document}
```

---

**tkz-linknodes**

The following text is from [http://www.sir-lancelot.co.uk/camelot.htm](http://www.sir-lancelot.co.uk/camelot.htm).

"In some versions of the legend, one of Lancelot’s first tasks as a knight was to bring Guinevere to Camelot for her wedding to Arthur. During their journey back to Camelot, Guinevere and Lancelot fell in love. In other stories, Guinevere was already Queen when Lancelot arrived, and he became one of the Queen’s Knights. Lancelot soon became recognised as the greatest of the knights after successfully completing several quests.

... Lancelot helped King Arthur put down the rebellion of Galehaut the Haut Prince, who surrendered to Arthur after being influenced by Lancelot’s chivalry in battle. Later Galehaut became Lancelot’s close friend and acted as a secret go-between between Lancelot and Guinevere."
A better method of solving this problem is obtained by raising box. I use \TeX for that but perhaps there is a \LaTeX method. I remove \texttt{\textbackslash AddNode} and insert \texttt{\raise -1.2ex\hbox{\AddNode}}. 

"In some versions of the legend, one of Lancelot's first tasks as a knight was to bring Guinevere to Camelot for her wedding to Arthur. During their journey back to Camelot, Guinevere and Lancelot fell in love. In other stories, Guinevere was already Queen when Lancelot arrived, and he became one of the Queen's Knights. Lancelot soon became recognised as the greatest of the knights after successfully completing several quests.

Lancelot helped King Arthur put down the rebellion of Galehaut the Haut Prince, who surrendered to Arthur after being influenced by Lancelot's chivalry in battle. Later Galehaut became Lancelot's close friend and acted as a secret go-between Lancelot and Guinevere."

* to feel in love?
* go-between?
