

SUTRA

A Workflow for Documenting Signals

Pavneet Arora

Portland calls out for signals documentation!

PART I

A Day in the Life of Pavan Signalovich

“My system has stopped working...”

“A customer is the most important visitor on our premises. He is not dependent on us. We are dependent on him. He is not an interruption in our work. He is the purpose of it. He is not an outsider in our business. He is part of it. We are not doing him a favor by serving him. He is doing us a favor by giving us an opportunity to do so.”

– Mahatma Gandhi

In the lament...

Ay-Ay-Ay-Ay-Ay

...lies a way to frame the problem

I-I-I-I-I

How do we make sense of signals?

Identity

Interface

Intent

Implementation

Interaction

Even with a clean installation, we still need proper signals documentation

PART II

Schematics

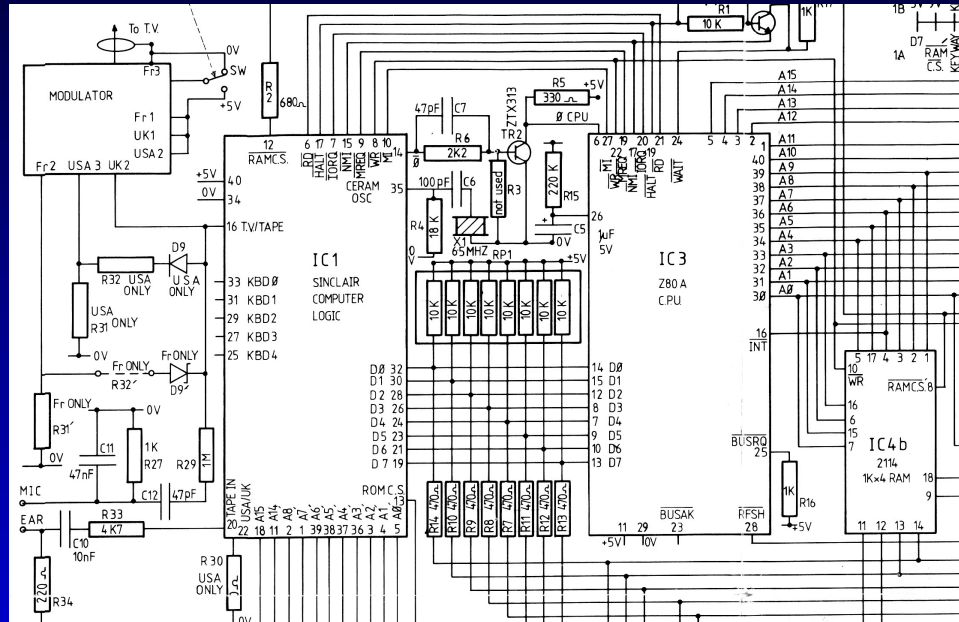

Using Dia/Visio

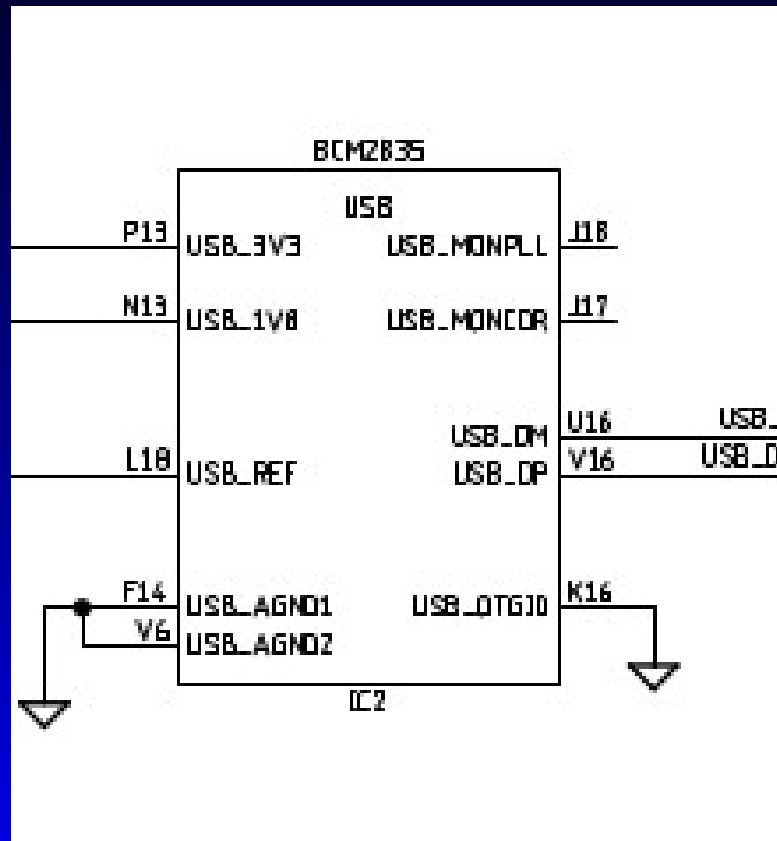

Either shrink the drawing, or
increase the size of the paper

Sinclair ZX81

Raspberry Pi Model B SoC

A Modern A/V Receiver

Layers

Sharing	Within the same layer
Traversal	Across different layers
Isolation	Standalone

Pros of schematics

- Help to visualize the circuit board or VLSI die.
- Good for designing the layout.
- Can show *src* and *dest* at a glance.
- Details can be pushed to the appendices so that they don't clutter up the visual representation.
- Puts everything on a single sheet of paper.

Cons of schematics

- The application may be electronic, but I am not working with a single **circuit board**. I am dealing with the physical plant of a building.
- But I am not designing the **layout**. I am either trying to understand the system as-built, or designing the connections needed for the system.
- At a glance? Are you serious? Have you taken a look at the example schematics? **Does NOT** allow one to see *src* and *dest* at a glance.
- Lots of details are left to **appendices** so you end up referring to both. My head hurts when I go back and forth so often, and I lose my train of thought.
- Sure, everything can be put on a single sheet of paper, as long as the piece of paper has **infinite area**. And when I have crawled into an equipment closet in the dark, contorted my back to get in, it isn't that easy to pull out Arch E size paper and start writing.

Some more cons of schematics

- Doesn't handle the distinctions of **physical** and **notional** location very well.
- Difficult to update. This is the **word-processing** of signals documentation. You end up spending most of your time on layout rather than capturing information about the signals.

Layout niceties
vs.
Connection Details

PART III

In Sanskrit, sutra means thread or string

Noguchi Filing System

A filing system credited to the Japanese economist, Yukio Noguchi.

PART III

SUTRA's Implementation

Components

- Physical location of the component
- Notional location of the component
- Signal layers that it operates on
- Input and output connections

Connections

- Ports
- *Src* and *dest* port details
- Intent

From TUG 2012 (Boston, MA)

YAWN—Sleep De(p)rived Typesetting

YAML

Algebra

Words

Numbers

A L^AT_EX enabled workflow that decoupled the data, its processing, and subsequent typesetting by using YAML to store specification and catalogue data and Ruby to do the processing.

From TUG 2012 (Boston, MA)

A perfectly good framework already exists:

MODEL–VIEW–CONTROLLER

Model	YAML representations of the specification and price catalogue
View	L ^A T _E X enabled shell script
Controller	Ruby program that contains the business logic

From TUG 2013 (Tokyo, Japan)

T_EX and

Aymptote driven

Nomenclature for

Storage

Unit layout.

A workflow to quickly explore different cabinet layouts and costing options.
