A \textit{fibeamer} user guide
for the Faculty of Economics and Administration

Bachelor’s Thesis

Advisor: Doc. RNDr. Petr Sojka, Ph.D.

Author: Vít Novotný

Brno, 2017
Abstract

Fibeamer is a theme for the beamer \LaTeX document class and is intended to be used for the preparation of thesis defense presentations across the faculties of the Masaryk University. This document describes the installation of the fibeamer theme, its configuration, and its use.
Keywords

thesis, typesetting, \LaTeX
Declaration

Hereby I declare that this paper is my original authorial work, which I have worked out on my own. All sources, references, and literature used or excerpted during elaboration of this work are properly cited and listed in complete reference to the due source.

2 Configuration 13
1 Introduction

To use the fibeamer beamer theme, you can use an online \LaTeX\ editor, such as Overleaf\(^1\), which allows you to skip the installation described in Section 1.1 completely.

1.1 Installation

1.1.1 Installing a \TeX\ distribution

If you decided not to use a public \TeX\ distribution, you will need to install one locally before proceeding further. A \TeX\ distribution contains tools and packages that are going to help you with preparing and typesetting your \LaTeX\ documents.

The two major \TeX\ distributions that you can install are Mik\TeX\\(^2\), which can be used with the Microsoft Windows operating system, and \TeX Live\(^3\), which can be installed on both Unix and Windows operating systems. The advantages of Mik\TeX\ include refined graphical user interface and the ability to install new packages on the fly.

Along with Mik\TeX, you will also need to install a Perl interpreter, such as Strawberry Perl\(^4\). \TeX Live installs a Perl interpreter by default.

1.1.2 Installing packages

In order to function properly, fibeamer needs the following packages to be installed in your \TeX\ distribution: ifthen, ifxetex, ifluatex, \textit{lm}, carlito, arev, iwona, dejavu, setspace, fontenc, fontspec, beamer, fibeamer.

If you performed a full installation of \TeX\ Live, you should already have all the required packages installed. If you are using a partial installation of \TeX\ Live, you can use the \texttt{tlmgr} command-line tool by executing \texttt{tlmgr install \langle pkgname \rangle}, where \langle pkgname \rangle is the name of the package you wish to install. In some cases, \TeX\ Live may assign a different name to a package. To find out the \TeX\ Live name of a package, open the \texttt{http://www.ctan.org/pkg/\langle pkgname \rangle} webpage in a web browser. It should contain the following text:

\begin{center}
\texttt{Contained in \TeX\ Live as \langle texlivename \rangle}
\end{center}

where \langle texlivename \rangle corresponds to the \TeX\ Live name of the package. Use this name instead of \langle pkgname \rangle with \texttt{tlmgr}. Alternatively, you can download the packages manually from \texttt{http://www.ctan.org/pkg/\langle pkgname \rangle} and extract them into the \texttt{texmf/} directory located in your user home directory. Mind that the packages themselves may depend on other packages; if you are using a partial installation of \TeX\ Live, you will have to resolve these dependencies manually by inspecting the documentation of each package.

If you use Mik\TeX\ and you enabled the over the air installation of packages during the installation, Mik\TeX\ will automatically download all the required packages, when you

\(^1\) Overleaf fibeamer templates are located at \texttt{http://www.overleaf.com/gallery/tagged/muni}.
\(^2\) Mik\TeX\ can be acquired from \texttt{http://miktex.org/2.9/setup}.
\(^3\) \TeX\ Live can be acquired from \texttt{http://www.tug.org/texlive}.
\(^4\) Strawberry Perl can be downloaded from \texttt{http://strawberryperl.com/}.
first typeset a fibeamer document. If you didn’t enable this feature, you will need to enter the MikTeX package manager by running

Start › MikTeX › MikTeX Package Manager (Admin)

and download the packages manually through the user interface. In some cases, MikTeX may assign a different name to a package. To find out the MikTeX name of a package, open the http://www.ctan.org/pkg/⟨pkgname⟩ webpage in a web browser, where ⟨pkgname⟩ is the name of the package you wish to install. It should contain the following text:

Contained in MikTeX as ⟨miktexname⟩

where ⟨miktexname⟩ corresponds to the MikTeX name of the package. If you still can’t find the package, try synchronizing the package database by selecting

Repository › Synchronize

from the menu bar of the MikTeX package manager. Mind that the packages themselves may depend on other packages; if you disabled the over the air installation of packages, you will have to resolve these dependencies manually by inspecting the documentation of each package.

If you wish to use a newer version of fibeamer than the one that is available in your TeX distribution, you should download a file named fibeamer.tds.zip containing the version of the package you wish to use and place it in a root directory that is recognized by your TeX distribution. In TeX Live5, one of such directories is the texmf/ folder in your user home directory. In MikTeX6, the list of recognized root directories can be gleaned by running

Start › MikTeX › MikTeX Options (Admin) › Roots

1.2 Picking a TeX engine

There are several programs, called TeX engines, that you can use to typeset fibeamer TeX source files into displayable PDF documents. The ones we will discuss are pdfTeX and LuaTeX.

PdfTeX is the more conservative choice and most TeX editors use pdfTeX as the default TeX engine. The main advantage LuaTeX over pdfTeX for a fibeamer user is the ability to use standard OpenType and TrueType fonts installed on your system, whereas pdfTeX is confined to the fonts installed in your TeX distribution.

If the ability to use arbitrary fonts within your documents interests you, Chapter 3 of the fontspec package manual7 should provide you with the relevant information. If you are only going to use the fonts present in the TeX distribution or if you do not intend to change the preset fibeamer fonts at all, you can safely use pdfTeX, which is currently also considerably faster than LuaTeX.

5. For more information about the TeX Live root directories, see http://www.tug.org/texlive/doc/texlive-en/texlive-en.html#xl-11002.3, Chapter 2.3.
6. For more information about the TeX Live root directories, see http://docs.miktex.org/manual/localadditions.html.
1.3 Creating and typesetting a fibeamer document

Before using the fibeamer theme, it is useful to be familiar with the LaTeX typesetting system. A good way to get started is to read one of the introductory texts in English [1–4] or in Czech [5, 6]. Taking one of the FI:PB029, PF: M5751, or FF: PLIN028 courses taught at the Masaryk University is also helpful.

To become familiar with fibeamer, you are encouraged to inspect the example fibeamer documents named mu-econ-pdflatex.pdf and mu-econ-lualatex.pdf as well as their LaTeX source files that are named mu-econ-pdflatex.tex and mu-econ-lualatex.tex. These example documents are distributed along with the package inside the example/ directory. By modifying and by typesetting these LaTeX source files using either the pdflatex or the LuaTeX engine, you can quickly gain a working knowledge of LaTeX and use these source files as the basis for your thesis.

If you are using an online editor, such as Overleaf, LaTeX source files will be typeset automatically, as you edit them. The TEX engine can be selected inside the project settings.

If you are using a graphical TEX editor, such as TEXworks, you can typeset a LaTeX source file by opening the source file from within the editor and running either the pdflatex or LuaLaTeX (depending on your choice of TEX engine) command from the task bar. The command needs to be executed at least twice.

If you are using the command line, you can typeset LaTeX source files by running either pdflatex name.tex or lualatex name.tex (depending on your choice of TEX engine), where name.tex corresponds to the name of a LaTeX source file. In the case of the two aforementioned example files, the corresponding commands would be:

```
pdflatex mu-econ-pdflatex.tex
lualatex mu-econ-lualatex.tex
```

The command needs to be executed from within the directory, where the LaTeX source file is located. In Windows, the command line can be opened in a directory by holding down the Shift key and by clicking the right mouse button while hovering the cursor over a directory. Select the Open Command Window Here option in the context menu that opens shortly afterwards. The command also needs to be executed at least twice.

Beside Overleaf and TEXworks, any text editor can be used to modify LaTeX source files.

---

8. The example fibeamer documents are also available online at http://mirror.ctan.org/macros/latex/contrib/beamer-contrib/fibeamer/example/mu. To typeset the example documents, you need to download the resources/ directory as well, as it contains vector images used in the examples.
10. TEXworks can be downloaded from http://www.tug.org/texworks/.
2 Configuration

A fibreamer \LaTeX{} source file should begin as follows:

\begin{verbatim}
\documentclass{beamer}
\usetheme[option1, option2, ..., optionN]{fibeamer}
\end{verbatim}

The following list summarizes the options that are recognized by the fibreamer theme and their meaning. Options that are enabled by default are \emph{set in italics}.

\texttt{faculty}=$\langle$\texttt{name}$\rangle$ This option changes the color theme based on the selected faculty. To choose the color theme of the Faculty of Economics and Administration, use \texttt{econ} as the $\langle$\texttt{name}$\rangle$.

\texttt{fonts} This option sets up the combination of the font families of Carlito, Arev, Iwona, Dsfont, and DejaVu for the typesetting of text and mathematics.

\texttt{nofonts} This option prevents fibreamer from setting up the fonts. The user must set the fonts manually in the preamble of the document.

\texttt{microtype} This option sets up microtypographic extensions\footnote{For more information about the \LaTeX{} engine microtypographic extensions, see \url{http://mirrors.ctan.org/macros/latex/contrib/microtype/microtype.pdf}.}, which results in visually more pleasing paragraphs of text.

\texttt{nomicrotype} This option prevents fibreamer from setting up microtypographic extensions.

The complete list of the package options can be found in Section 2 of the technical documentation of the fibreamer class \cite{fibeamer}. 

---

\footnote{For more information about the \LaTeX{} engine microtypographic extensions, see \url{http://mirrors.ctan.org/macros/latex/contrib/microtype/microtype.pdf}.}
