2013/04/27

Abstract
This package offers the command \DeclareFloatingEnvironment for defining new floating environments which behave like figure and table.

Contents

1 Loading the package 2
2 \DeclareFloatingEnvironment 2
3 \SetupFloatingEnvironment 3
4 \ForEachFloatingEnvironment 4
5 \PrepareListOf 4

∗This package has version number v1.1.
1 Loading the package

First of all you need to include this package into your document with

\usepackage[⟨options⟩]{newfloat}

where ⟨options⟩ are one or more of

\begin{itemize}
  \item within=⟨“within” counter⟩ or none\footnote{The “within” counter specifies the counter which will be used to reset the counter of the floating environments figure and table. (Furthermore this setting will be used as default setting for \textbackslash DeclareFloatingEnvironment.)}
  \item chapterlistsgap=⟨value⟩
\end{itemize}

The “within” counter specifies the counter which will be used to reset the counter of the floating environments figure and table. (Furthermore this setting will be used as default setting for \textbackslash DeclareFloatingEnvironment.)

So for example within=chapter will give you a numbering scheme ⟨chapter⟩⟨x⟩ for floating environments, while within=section will give you a numbering scheme ⟨chapter⟩⟨section⟩⟨x⟩, or ⟨section⟩⟨x⟩ if the document class does not offer \textbackslash chapter. within=none will result in a continuous numbering throughout the document, i.e. the numbering scheme will be simply ⟨x⟩.

The option chapterlistsgap=⟨value⟩ sets the amount of the vertical gap inserted into the “List of Figure”, “List of Tables”, and all lists created with \textbackslash DeclareFloatingEnvironment when a new chapter will be started. The default value is 10pt. (This option will only be available if the document class used offer the usage of chapters, e.g. the book or report document class.)

Both options can be changed later on, too, by using the command

\newfloatsetup⟨options⟩ ,

2 \textbackslash DeclareFloatingEnvironment

After loading the newfloat package you can define your own floating environments with

\DeclareFloatingEnvironment[⟨options⟩]{⟨type⟩}

where ⟨options⟩ are one or more of

\begin{itemize}
  \item fileext=⟨file extension⟩
  \item listname=⟨list name⟩
  \item name=⟨prosa name⟩
  \item placement=⟨combination of htpb⟩
  \item within=⟨“within” counter⟩ or none\footnote{Please note that although the newfloat package tries hard to offer this option it may not be available or is working incorrectly in cooperation with your document class since there is no standard interface which we could use for that purpose. Therefore we have to try to patch the \textbackslash chapter command, and if this fails, we try to patch \textbackslash addtocontents (in an unusual way) instead.}
  \item chapterlistsgap=⟨on or off⟩
\end{itemize}

If no ⟨options⟩ are given, “lo⟨type⟩” will be used as ⟨file extension⟩ for the list, “List of ⟨name⟩” as ⟨list name⟩. “⟨name⟩” as ⟨name⟩ (but with the first letter capitalized), “tbp”
as \textit{placement} specifier, and "chapter" resp. "none" as \textit{within} \textit{counter}, i.e., the counter which resets the numbering.

The default value of the \texttt{chapterlistsgaps=} option depends on the \textit{within} setting, it is set to \texttt{on} if \texttt{chapter} or \texttt{section} is selected, otherwise it is set to \texttt{off}. (This option will only be available if the document class used offer the usage of chapters, e.g. the \texttt{book} or \texttt{report} document class.)

The list will be typeset using the command \texttt{\listof(type)s} resp. \texttt{\listof(type)es}, analogous to \texttt{\listoffigures} and \texttt{\listoftables}.

If the \texttt{fcpage} package is loaded, an environment called \texttt{FP\{type\}} will be defined additionally, same for \texttt{sideways\{type\}} (\texttt{rotating} package), \texttt{SC\{type\}} (\texttt{sidecap} package), and \texttt{wrap\{type\}} (\texttt{wrapfig} package).

So for example

\begin{verbatim}
\DeclareFloatingEnvironment{diagram}
\end{verbatim}

will define a new floating environment called \texttt{diagram}, the list will be stored in a file with the extension \texttt{lodiagram}, the name (used for the caption) will be "Diagram" and the list name "List of Diagrams". The list could be typeset with \texttt{\listofdiagrams}. Dependent on which packages are loaded, the environments \texttt{FPdiagram}, \texttt{sideways-diagram}, \texttt{SCdiagram}, and \texttt{wrapdiagram} will be defined additionally.

Another example:

\begin{verbatim}
\DeclareFloatingEnvironment[
    fileext=lox,
    listname={List of Matrixes},
    name=Matrix,
    placement=p,
    within=section,
    chapterlistsgaps=off,
    ]{matrix}
\end{verbatim}

will define a new floating environment called \texttt{matrix} with the given settings. Please note that names which contain spaces needs to be enclosed in curly braces.

\section{SetupFloatingEnvironment}

While \texttt{\DeclareFloatingEnvironment} will create new floating environments, \texttt{\SetupFloatingEnvironment\{\textit{floating environment}\}\{\textit{options}\}} will change the settings of existing ones, i.e. either \texttt{figure} or \texttt{table}, or a one created with \texttt{\DeclareFloatingEnvironment}, or a one created with \texttt{\newfloat} offered by the \texttt{float} package, or a one created with \texttt{\newfloat} offered by the \texttt{memoir} document class, or a one created with \texttt{\DeclareNewFloatType} offered by the \texttt{floatrow} package, or . . .

The \texttt{\textit{options}} are the same as the options for \texttt{\DeclareFloatingEnvironment}, but one should avoid changing the file extension of existing floating environments, i.e. using the \texttt{fileext=} option within \texttt{\SetupFloatingEnvironment} is usually a very bad idea.
An example:
\SetupFloatingEnvironment{lstlisting}{chapterlistsgaps=off}
will switch off the chapter lists gaps for lstlisting environments offered by the listings package.

4 \ForEachFloatingEnvironment
\ForEachFloatingEnvironment\{\textit{(code with #1)}\}
will execute the given \textit{(code)} for all known floating environments, and for ones defined with \texttt{\DeclareFloatingEnvironment} later on.
So for example the subcaption packages uses
\ForEachFloatingEnvironment\{\texttt{\DeclareCaptionSubType{#1}}\}
for initializing itself for all floating environments which are known to the newfloat package.
There is also a starred variant \ForEachFloatingEnvironment* which will execute the given code for already existing floating environments only, i.e. no hook will be placed inside \texttt{\DeclareFloatingEnvironment}.
An example:
\ForEachFloatingEnvironment*\{\texttt{\typeout{#1}}\}
will typeout the names of all already known floating environments to the terminal and log file.

5 \PrepareListOf
Unfortunately there is no standardized way of typesetting and customizing lists of floating environments, i.e. every document class offers it’s own stuff here, and there are plenty of \LaTeX\ packages for this purpose.
For that reason the the newfloat package simply typesets the lists of newly defined floating environments as “List of Figure” internally (using \texttt{\listoffigure}) but using a different list (the right one, of course) and using a different list name, the one you have specified with either \texttt{\DeclareFloatingEnvironment} or \texttt{\SetupFloatingEnvironment}.\footnote{Please note that this is not the fact when using a KOMA-Script document class, not \texttt{\listoffigure} but \texttt{\listoftoc} will be used here, and therefore no problems should occur.}
While this usually results in the same layout as the “List of Figure” and is sufficient for most cases, there are some cases where this might lead to an unwanted side effect.
Therefore the the newfloat package offers
\PrepareListOf\{\textit{(floating environment)}\}\{\textit{(code)}\}
which will execute the given \textit{(code)} right before actually typesetting the list with \texttt{\listoffigures} internally.
One example:

\PrepareListOf{diagram}{%
  \renewcommand{\cftfigpresnum}{Diagram˜}}

will change the part typeset in front of the diagram number within the “List of Diagrams” when using the tocloft package [8]. Without the code above you will get the part defined for figures instead.

However, when dealing with the tocloft package it’s a better idea not to use \PrepareListOf but the customization facilities of that package instead, e.g.:

\documentclass{book}
...
\usepackage{newfloat,tocloft}
\newlistof{diagram}{lod}{List of Diagrams}
\DeclareFloatingEnvironment[name=Diagram,fileext=lod]{diagram}
  % Note: Due of a bug in tocloft the file extension
  % must be repeated at \DeclareFloatingEnvironment,
  % otherwise you will get an empty list.

% Customize ‘List of Figures’
\renewcommand{\cftfigpresnum}{Figure˜}
\setlength{\cftfignumwidth}{2cm}

% Customize ‘List of Diagrams’
\renewcommand{\cftdiagrampresnum}{Diagram˜}
\setlength{\cftdiagramnumwidth}{2cm}
...

\begin{document}
...
\listoffigures
\listofdiagrams
...
\end{document}
