The situation as-it-was

ConT_EXt strength in text

- powerful and fancy yet easy-to-use text formatting;
- powerful and easy-to-use interaction features;
- DTP-oriented features;
- METAPOST integration.

ConT_EXt weakness in math

- Little more than plain T_EX math built-in.
- (history) Taco's `m-math` module brought most $\mathcal{A}\mathcal{M}\mathcal{S}$ -L^AT_EX features to ConT_EXt, and some extra features (`breqn`).
- Overhaul of the font mechanism and other changes to core macros prevent the use of Taco's module but adds support for many of the symbol fonts available to L^AT_EX users; a very limited number of ($\mathcal{A}\mathcal{M}\mathcal{S}$ -)L^AT_EX features are added to the core and to the new math module `m-newmat`.

The new math modules

Purpose of the new modules is to:

- provide the same functionality provided by $(\mathcal{A}\mathcal{M}\mathcal{S}-)\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ and Nath, possibly with as much ease even if not necessarily with the same syntax;
- provide as much command compatibility as possible, so that compatible commands/environments are achieved with same or very similar commands;
- (low priority) add new features without breaking anything, in the spirit of graphics and interactivity peculiar to $\text{ConT}_{\text{E}}\text{Xt}$;
- (low priority) ensure documents aesthetical compatibility with $(\mathcal{A}\mathcal{M}\mathcal{S}-)\text{L}^{\text{A}}\text{T}_{\text{E}}\text{X}$ (for use of $\text{ConT}_{\text{E}}\text{Xt}$ in journals etc).

Project status: Nath

Nath is almost fully implemented: the module `t-nath` is based on the original \LaTeX package itself.

Side-effects of the adaptation:

- discovery of some bugs that affected the original package;
- robustness and enhancements, macro-wise (allowing for example extensible arrows in the sub- or superscript part of another extensible arrow) and engine-wise (making Nath aware of $\varepsilon\text{-TeX}$ and therefore allowing it to typeset more complex formulas, a job which requires a noticeably large amount of registers).
- the discovery of at least one situation in which the \LaTeX 's “protected expansion” mechanism can achieve something which $\varepsilon\text{-TeX}$'s enhanced macro expansion management cannot achieve (or the discovery of one more limit in my knowledge regarding \TeX macro expansion, its protection and the way this is implemented in ConTeXt ; whichever is most likely).

Project status: $\mathcal{A}\mathcal{M}\mathcal{S}$ - \LaTeX

Much less extensive work. $\mathcal{A}\mathcal{M}\mathcal{S}$ -specific features implemented include a very limited set of basic environment (e.g. aligned and gathered equations) and a few classic macros (e.g. `\eqref`).

Some work on non- $\mathcal{A}\mathcal{M}\mathcal{S}$ commands and environments has been done, e.g. an initial implementation of `\array`. Some fonts commands which in `ConTeXt` were only available in text mode were brought back to math mode (e.g. `\cal`, `\frac`) with the syntax familiar to \LaTeX users. This part of the module might in the future be moved to the core `m-newmat` module.

Since the Nath package provides already a wide range of features which overlap some of the $\mathcal{A}\mathcal{M}\mathcal{S}$ - $\mathcal{L}\mathcal{A}\mathcal{T}\mathcal{E}\mathcal{X}$ ones.

Do we want full syntax compatibility with $\mathcal{A}\mathcal{M}\mathcal{S}$ - $\mathcal{L}\mathcal{A}\mathcal{T}\mathcal{E}\mathcal{X}$?

▷ **No.**

Then we only need to implement $\mathcal{A}\mathcal{M}\mathcal{S}$ - $\mathcal{L}\mathcal{A}\mathcal{T}\mathcal{E}\mathcal{X}$ features not available through Nath, leaving more time for the implementation of new, more $\text{ConT}\mathcal{E}\mathcal{X}$ tish features (interactive and/or fancy formatted formulas?)

▷ **Yes.**

Then $\mathcal{A}\mathcal{M}\mathcal{S}$ - $\mathcal{L}\mathcal{A}\mathcal{T}\mathcal{E}\mathcal{X}$ must be fully implemented, and care must be taken for the cases when both modules are loaded (allow switching between the two sets of command?).
